The STEPS survey of chronic disease risk factors in Georgia was carried out from August to December 2010. Georgia carried out Step 1, Step 2 and Step 3. Socio demographic and behavioural information was collected in Step 1. Physical measurements such as height, weight and blood pressure were collected in Step 2. Biochemical measurements were collected to assess blood glucose and cholesterol levels in Step 3. The STEPS survey in Georgia was a population-based survey of adults aged 18-64. A multi-stage, clustered sample design was used to produce representative data for that age range in Georgia. A total of 6,497 adults participated in the Georgia STEPS survey. The overall response rate was 95\%.
