Acknowledgements

This strategy was developed by Dr Karen Boyle, the Coordinator of the Chronic Disease Unit, Ministry of Health and former PAHO/WHO consultant. A special thanks to Dr Shamdeo Persaud, Chief Medical Officer, Ministry of Health, and Ms Karen Roberts, Consultant, Non-communicable Diseases, PAHO/WHO, for their support in the finalizing of this strategy. Additionally, a sincere thank you to the following individuals:

Mr. Charles Fung-a Fatt

Background

Chronic Non-communicable Diseases (NCDs) are recognized as a growing international socio economic and public health problem, accounting for over 36 million of the 57 million deaths worldwide in 2008\(^i\). Of these deaths, 80% originated in the low and middle income countries. NCDs and non-intentional injuries represent nearly 70% of all causes of death in the Region of the Americas, mostly affecting those 18-70 years old. The Caribbean epidemic of chronic diseases - in particular, cardio vascular disease, diabetes, cancer and asthma- is the worst in the region of the Americas\(^ii\). These diseases are preventable: “Up to 80% of heart diseases, stroke, and type 2 diabetes and over a third of cancers could be prevented by eliminating shared risk factors, such as tobacco use, unhealthy diets, physical inactivity and the harmful use of alcohol.”\(^iii\)

In 2005, the Conference of Heads of Government in CARICOM took a decision to convene a Summit that would facilitate a multi-sector, comprehensive and integrated response to the issue of NCDs in the Caribbean. In September 2007, at the CARICOM Summit on Chronic Non-communicable Diseases (NCDs) the Declaration of Port of Spain (POS) was pronounced with the theme of “Uniting to Stop the Epidemic of Chronic Non-communicable Diseases”\(^iv\). This declaration provided a framework for policies and programmes across government ministries, the private sector, civil society, the media, non-governmental organizations (NGOs), academia and the community, “to make the right choice the easy choice.”\(^v\)

In recognition of the growing burden of NCDs and the huge threat they place on world development, on 24\(^{th}\) May 2012, at the 65\(^{th}\) World Health Assembly, a resolution was made and supported by over 50 countries to “adopt a global target of a 25% reduction in premature mortality from NCDs by 2025.”

The 2010-2015 Regional Health Framework of the Caribbean Cooperation in Health III (CCH III) recognizes the importance of “Investing in Health for Sustainable Development.”
The vision for the NCD strategy is in keeping with the Ministry of Health’s (MoH) vision “for Guyanese citizens to be among the healthiest in the Caribbean and the Americas”

The principles of the strategy are in sync with those of the MoH and the CCH III:

- The right to the highest attainable level of health and therefore the provision of services commensurate with needs
- Equity in access to quality health services regardless of origin, ethnicity, gender, geographic location or socio-economic status
- Solidarity between member countries-working together to define and achieve common good
- People centered – primary goal of meeting the needs of the people, families and communities
- Leadership in the public health sector that focuses on the attainment of health for all and a shared vision that creates an enabling environment for mobilizing resources, improving performance and ensuring greater cooperation and accountability within the region\(^v\). The CCH provides a mechanism for small member states to share “rare” medical specialists that are in demand within the region e.g. oncologists and endocrinologists.

CARICOM member states have embraced a Primary Health Care Approach as the overarching health development framework. This approach emphasizes the decentralization of the administration and provision of an essential package of primary health services to ensure equity in access to most, rather than investing huge sums into centrally located, tertiary health services that are affordable and accessible to few.

Guyana has observed a growing epidemic of NCDs which is in part a reflection of the effects of globalization, increased urbanization, population ageing, behavioral and lifestyle change, and the inadequacies of existing health promotion, disease prevention, diagnosis and management efforts.
NCDs can undermine the potential of an individual to earn a living or provide for themselves and family. Vulnerable populations are more likely to develop chronic diseases and low-income families are more likely to become further impoverished as a result of them. The World Health Organization’s 2008-2013 Action Plan for the Global Strategy for the Prevention and Control of Non-communicable Diseases emphasized the need for policies to protect the poor from the disproportionate burden of NCDs they carry. Furthermore, the action plan highlighted the need for investing in NCD prevention as an integral part of sustainable socioeconomic development. In recognition of the potential threat chronic diseases pose to socioeconomic development, the Government of Guyana is committed to investing in health sector development to ensure universal access to quality prevention, care and treatment services.

“Whole-of government-whole-of-society effort” WHA, Declaration of 2011
The health sector in Guyana is striving to build strategic partnerships with other ministries, civil society and the private sector to implement a comprehensive and integrated approach to preventing and mitigating the impact of NCDs. This is in alignment with the WHO 2008-2012 Global Action Plan that emphasizes the need for whole government involvement and the crucial role of non-health sector participation and policies to effectively address NCDs. The World Health Assembly of 2011 recommended “strong leadership and multi-sectoral approaches for health at the government level, including, as appropriate, health in all policies and whole-of-government approaches across such sectors as health, education, energy, agriculture, sports, transport, communication, urban planning, environment, labour, employment, industry and trade, finance and social and economic development.”

This strategic plan for NCDs utilizes the Caribbean Strategic Plan of Action for the Prevention and Control of NCDs as a framework to address the top four causes of premature death in Guyana: cardiovascular diseases, cancer, diabetes and chronic respiratory diseases ensuring a multi-sectoral, integrated approach is maintained.
SITUATIONAL ANALYSIS

Administration

Responsibility for health services in Guyana is being devolved from the Ministry of Health Central to Regional Health Authorities (RHA), and to Georgetown Public Hospital Corporation (GPHC). Regional Health Authorities were established under the RHA Act 2005 (and the Public Corporations Act in the case of GPHC) and serve as corporations contracted to deliver health services under the supervision and regulation of the Ministry of Health. RHA contracts specify the level and quality of services they should provide in return for the funding they receive. RHAs are established in Regions 4 and 6 while the remaining regional services are administered under the Regional Health Services Department of the MoH.

Economic Burden of NCDs in Guyana

In 2011 MoH/PAHO conducted a cost of illness assessment for NCDs using data from local and international sources and found that:

- the annual direct costs of treating diabetes and/or hypertension are estimated between US$7.2 million and US$10.8 million, with clinic visits and laboratory tests accounting for the highest burden of cost
- the annual direct cost of treating cancers and cardiovascular diseases are estimated between US$0.3 million and US$5.2 million with treatment and drugs accounting for the highest burden of cost
- annual indirect costs of all NCDs are estimated between US$207.5 million, 10% of GDP in 2010
- total annual costs accruing due to NCDs are estimated at US$221.5 million
Epidemiology

Mortality from NCDs
In 2005, an estimated 35 million people worldwide died from chronic diseases; this is double the number of deaths from all infectious diseases. While deaths from perinatal conditions and nutritional deficiencies are expected to decline by 3% over the next 10 years, deaths due to chronic diseases are projected to increase by 17% by 2015\textsuperscript{viii}. Over the last decade, ischemic heart disease, cerebrovascular disease and diabetes have been among the top five leading causes of death.

*Source: Adapted from MOH Statistics Bulletin, 2008*

A review of Ministry of Health statistical data shows that heart disease, external causes, cancer, diabetes mellitus, and chronic liver disease have accounted for over 2,000 deaths per annum since 2004\textsuperscript{ix}. MoH stats show that NCDs accounted for over 60% of deaths amongst males and over 70% of deaths amongst females in 2009.

**Major causes of death by age group are as follows:**

- Under 1 year: Respiratory diseases was the #1 cause
- *Under 5 years*: perinatal causes, acute respiratory infections (ARI), acute diarrhoeal disease and accidents/injuries.
- 5-14 years: accidents/injuries, ARI, diarrhoeal disease, cancer and malnutrition/anaemia.
- 45-64 years: ischaemic heart disease, cerebrovascular disease, diabetes, cancer.

Source: Ministry of Health Statistical Bulletin 2009
Table 4 Percentage of Mortality by Cause and Sex 2009

Premature death due to injuries and accidents were three times higher in males than in females. Chronic Non-communicable Diseases Cerebrovascular disease (Stroke) was the number one cause of death overall in 2009- 13.1% followed by Ischemic Heart Disease 13% and neoplasms 8.9%.

Figure 2- Mortality Rates for Type I Diabetes by sex in Guyana 2001-2006

Source: PAHO gender Analysis of NCDs in Guyana 2011 and MoH Statistical Bulletin

Cancer Mortality
In 2004, prostate cancer accounted for the highest mortality rate due to cancer, followed by cancers of the breast, cervix, colon, stomach, lung and liver in descending order.

Figure 3: Mortality rate by cancer sites 2004

Highest mortality rates occurred in patients over 65 years old in both sexes. There has been a steady increase in mortality due to genital cancer and breast cancer in women
from 2001-2008. A 56% increase in mortality from cervical cancer from 2001 to 2008 (MoH Stats).

Disability Adjusted Life Years (DALYs)
Non-communicable Diseases, as a group, are the main contributor to the burden of disease, accounting for 46.9% of all Disability Adjusted Life Years (DALYs) lost in 2000. Out of this, neuro-psychiatric disorders caused 16.4% and cardiovascular diseases, diabetes and malignant neoplasms accounted 13.3%. Asthma caused significant morbidity and was ranked 16th among the leading causes of lost DALYs and 6th among the leading causes of DALYs in 2000, causing 1.3% and 2.5% respectively.

Table 5 Disability Adjusted Life Years (DALY's) for Latin America and the Caribbean

![Table 5](http://www.paho.org/english/ad/dpc/nc/nc-home.htm)

Data on some chronic diseases such as sickle cell anemia is not routinely collected and as such, a special survey to determine the burden of this disease will be needed. Data on sickle cell disease prevalence is relevant to this strategy as complications of sickle cell disease include pulmonary fibrosis, kidney failure, stroke and retinopathy which can also be complications of diabetes, hypertension or dyslipidemia, For this reason and because
of an over 40% afro and mixed population base, sickle cell disease will also be included in the Guyana-specific strategy for NCDs.

**Morbidity due to NCDs**

**Figure 4: Incidence of first visits to health facilities**

![Incidence of first visits to health facilities](image)

**Figure 5 - Four weekly Chronic Disease Report by sex, MoH 2009**

![Four weekly Chronic Disease Report by sex, MoH 2009](image)
Hypertension and diabetes are the leading causes for patients to attend chronic disease clinics in Guyana.

NCDs can go undiagnosed and this can be due to multiple factors including poor uptake of health services by persons who feel “well”, failure of providers to screen new and existing patients for NCDs or their complications, miss-diagnosis, and possible weaknesses in the surveillance and reporting system.

**Hypertension**

There has been an increase in the incidence of hypertension in Guyana from 2001 to 2011 (See Figure 6 below). There are around 15,000 new cases of hypertension diagnosed each year and a higher prevalence is found in people older than 50. Hypertension is associated with a high mortality and is the fifth leading cause of death in Guyana.

**Figure 6: Incidence of Hypertension in Guyana 2001-2011**

**Cancer**

The incidence of cancer in Guyana has increased over the period 2000-2011. The principal cancers were breast (15.4 %), prostate (14.6%) and cervical (12.9 %). Whereas
in 2009 prostate- 38% (male), breast-23% (female), cervical- 21% (female), intestinal-9% (both sexes), lung-2% and all other-4% (MoH Stats). The annual figures are shown in the table 6.

The prevalence of asthma in the Caribbean is high and rising, with significant morbidity and mortality, despite the existence of evidence based protocols for its management and control. Guyana has developed and trained doctors on its Standard Treatment Guidelines for Primary Health Care which captures the management of the common NCDs. However there remains a need for protocols and flow charts to guide the general management of a NCD case ensuring linkages to other services and screening for complications. Chronic Respiratory Diseases accounted for 28.5% and 23% of the male and female burden of NCDs respectively in the year of 2009.

Diabetes

Approximately 74% of all people with diabetes are in their productive years i.e. under 65 years and more females than males are affected. Each year an average of over 7,000 new cases of diabetes are diagnosed across Guyana.

THE LINKS BETWEEN TUBERCULOSIS AND DIABETES

- People with a weak immune system, as a result of chronic diseases such as diabetes, are at a higher risk of progressing from latent to active TB.
- People with diabetes have a 2-3 times higher risk of TB compared to people without diabetes.
- All people with TB should be screened for diabetes.

People with diabetes who are diagnosed with TB have a higher risk of death during TB treatment and of TB relapse after treatment.

The National Tuberculosis Programme in Guyana started screening all TB patients for Diabetes in 2010. In 2010 7% of the new TB patients were found to be diabetics and in 2012 4.8% of the new TB patients were diabetics. TB patients with diabetes are placed on WHO recommended treatment like all other categories of TB patients.

Chronic Respiratory Diseases
Cardiovascular Disease, Stroke
Diabetes Mellitus and their complications
Risk factors for chronic diseases can be divided into physiological, behavioral or lifestyle, social and environmental influences. Most of the behavioral and lifestyle factors are amenable to modification through education, sensitization, social learning. Man, however is a social being and there are social, economic and political factors that can facilitate or serve as barriers to an individual having the agency to make healthy choices. It is important to appreciate the social determinants of health in order to address them effectively and systematically.

**Physiological**

**Physiological factors** causing chronic diseases can be non-modifiable - age, gender and family history or genetic constitution and modifiable factors such as high blood pressure, obesity, high blood sugar and cholesterol.

**The Life Course Approach** to chronic diseases recognizing the long term sequelae to in utero- stressors such maternal malnutrition and the emergence of the thrifty phenotype: at birth and/or in early infant life - decreased growth, and increased risk for type 2 diabetes and metabolic syndrome in adulthood. Low birth weight has been found to lead to increased risk for hypertension, obesity and diabetes in adulthood. Based on this understanding, any preventative interventions concerning NCDs should include antenatal and early childhood development interventions. Stunting is lower among children whose mothers have more than secondary education (16 percent) and highest among children from Interior locations (35 percent). Rates of low birth weight in Guyana have increased from 11.2% in 2000 to 18.9% in 2006. MOH figures report 13% of babies born in 2008 weighed less than 2,500g. Almost one in five children (18 percent) under age 5 is short for age or stunted.

The 2009 Demographic and Health Survey found that the prevalence of anemia is highest for children 9-11 months (74 percent) and lowest for those 36-59 months (25 to 28 percent). The percentage of children with anemia is lowest among children of mothers with secondary or higher education (38-40 percent) and among children of mothers in the highest wealth quintile (32 percent). These findings suggest that 1) the education of
mothers in general, 2) the focused effort to teach mothers in Interior locations the importance of balanced diets, supplements and anti-helminthes and 3) provision of accessible, culturally appropriate primary health services are critical to preventing stunting and anemia in our children.

Past socioeconomic status and nutrition during childhood and development influence the height attainable as an adult. Low pre-pregnancy BMI and short stature are risk factors for poor birth outcomes and obstetric complications.

*Source: MoH 2009, Statistical bulletin*

Guaya not unlike its Caribbean counterparts, has observed a rising trend in obesity and other forms of malnutrition. Obesity was shown to be a growing concern in adults in both the 1997 micronutrient survey and the 1999 Physical Activity Survey in Guyana. The physical activity survey showed 51% of adults over age 20 had a BMI of 25 and higher, and 22.4% of them were classified as obese (BMI >30). Significantly more women than men were obese (20% vs. 6%). The prevalence of obesity increased with age, with persons 50-64 years old having three times higher levels of obesity than those aged 20-30 (33% vs. 11%). The Global School-Based Student Health Survey of 2010 found 15.9% of girls and 14.6% of boys aged 13-15 years were overweight and 3.6% of girls and 4.6% boys of the same age group were obese. The Demographic and Health Survey reported 6% of children under the age of 5 are overweight in Guyana.
WHO rationale for the surveillance of overweight and obesity(xii):

- Obesity increases the risks of cancer of the breast, colon, prostate, endometrium, kidney and gall bladder\textsuperscript{xv}.
- Overweight and obesity lead to adverse effects on blood pressure, cholesterol, triglycerides and insulin resistance. Risks of coronary heart disease, ischemic stroke and type 2 diabetes mellitus increase with increasing BMI\textsuperscript{xvi}

**Raised blood pressure**

WHO rationale for the surveillance of elevated blood pressure\textsuperscript{xvii}:

- Raised blood pressure is a huge risk factor for coronary heart disease and ischemic and hemorrhagic stroke\textsuperscript{xviii}
- The risk of cardiovascular disease doubles for each increment of 20/10 mmHg of blood pressure, starting at 115/75 mmHg\textsuperscript{xix}
- Complications of raised blood pressure include heart failure, peripheral vascular disease, renal impairment, fundal hemorrhages, and papillodema\textsuperscript{xx}
- Treating systolic and diastolic blood pressures to targets that are less than 140/90 mmHg is associated with a decrease in cardiovascular complications\textsuperscript{xxi}
- Staging the management of hypertension:

**Raised blood glucose**

WHO recommends surveillance for elevated blood glucose because it is a serious metabolic disorder that can insidiously damage microcirculation and nerve cells, often going unnoticed until irreparable damage has occurred. Early detection and adequate management of DM are required to reduce the incidence of peripheral neuropathies, amputations, chronic leg ulcers, blindness, loss of productivity and ultimately, premature death.

Two or more fasting blood glucose levels of >126 mg/dl or a random blood glucose of > or equal to 200 mg/dl are used to define diabetes in Guyana. Alternatively, a 2 hour
glucose tolerance test of over 200mg/dl can be used. Screening for Pre-diabetes can be extremely beneficial including follow up with women with h/o Gestational diabetes. HbA1C is the preferred method to monitor the management of diabetes.

**Abnormal blood lipids**

Testing for lipid profiles is not readily available in the public sector though its utility is readily recognized. The magnitude of this problem in Guyana is not quite known due to the unavailability of reliable data. No national surveys or studies on the prevalence of dyslipidemia have been done in Guyana. The link between high blood lipids and the development of coronary heart disease and ischemic cerebrovascular disease has been established.

**Behavioral**

The physiological risks which lead to chronic diseases are caused mainly by modifiable, lifestyle-related, socially –determined behavioral risk factors, namely unhealthy diet, physical inactivity, tobacco use and harmful use of alcohol.

**Picture: Source: Ministry of Culture Youth and Sport Strategic Plan**
Unhealthy diet

PAHO has attributed the rising trend in obesity in the Caribbean to the “nutrition transition” as more persons are choosing foods rich in trans-fats, salt and sugar instead of the traditional fresh fruits, peas and vegetables. As the caribbean adopts the western diets, they are also adopting the western sedentary life style- both key factors in the rise of obesity.xxii PAHO reports that the LAC region utilizes > 160% of the average requirement for fats and >250% for sugars.

To combat the issue of unhealthy eating habits, the Ministry of Health has developed the Guyana Food based Dietary Guidelines which are available on the MoH website www.health.gov.gy, and the Guyana Nutrition Strategy 2011-2015. There is a Basic Nutrition Programme: a Government of Guyana / Inter-American Development Bank (GoG/IDB) programme which was initiated in 2004. The programme has four (4) components, namely:

- Component 1: Maternal and child anaemia: prevention and treatment
- Component 2: The development and scaling up of national growth promotion strategy and national nutrition surveillance
- Component 3: Community-based child health interventions in Regions 1, 7, 8, 9
- Component 4: Information, Education, and Communication campaign on nutrition

The Food and Agriculture Organization of the United Nations contends that agriculture’s current production is still unable to meet the minimum food energy requirements for approximately 1 billion people of the world, while 2 billion are suffering from “hidden hunger” caused by micronutrient deficiencies and an estimated 1.5 billion adults are overweight and at greater risk of NCDs. The goal therefore is to restore the bridge between agriculture and health since good health depends on good nutrition and good nutrition depends on agriculture to provide the foods.¹

Agriculture plays a pivotal role in improving food and nutrition security in Guyana, especially for under nutrition and over nutrition. The sector has to assure a consistent supply of the right foods to meet the dietary needs of the population, while providing for the sustainable livelihood of the producers. It is important therefore for Guyana to be food secured, taking cognizant of the 4 key pillars of food security; availability, accessibility, utilization and stability.

Guyana is self sufficient in food and is a net exporter of food in the CARICOM region. However, while food availability is not a major issue of the country being food secure, accessibility and utilization of sufficient quantities of the right foods are of great concern. In order to sustain and improve food security in Guyana, the Government, through the Ministry of Agriculture has developed the Guyana Food and Nutrition Security Strategy (GFNSS): 2011-2020 Plan. This strategy is aimed at improving the health and well-being of all persons living in Guyana through enhanced food and nutrition security. The strategy has 3 goals, namely;

- To facilitate sustainable and stable employment generating opportunities that would increase availability of and accessibility to food, especially among more vulnerable groups,
- To promote systems (information, education and communication/ dissemination) for use and consumption of healthy foods for increased nutrition of all Guyanese, and especially vulnerable groups; and
- To promote increased institutional coordination and functioning for improved food and nutrition security.

**Physical inactivity**

Physical activity and sports are considered basic human rights essential for the full development of personality, physical, intellectual and moral prowess and should be guaranteed both within the educational system and in other arena of social life.

---

Urbanization and globalization have both influenced the lifestyles of the average Guyanese. Sedentary lifestyles encouraged by the introduction of televisions and personal computers are becoming more prevalent. The Ministry of Culture Youth and Sport has addressed the need for more physical activity in its Strategic plan: Objective 1- To increase participation in sports and physical activity in Guyana to reduce the incidence and severity of chronic Non-communicable Diseases caused by physical inactivity, including heart disease, strokes, Type II diabetes, and obesity. This Ministry is committed to partnering with the Ministry of Education and Health to mobilize more Guyanese to be physically active throughout their lifespan.

**Picture:** Source: Ministry of Culture Youth and Sport Strategic Plan

### Smoking

Tobacco consumption is the leading cause of avoidable death in the Americas. It is the cause of over one million deaths in the Region each year. Fifteen percent of the overall Guyanese population are smokers, with significantly more men smoking than women (35% vs. 4%). To address this harmful behavior, knowledge alone is not enough. Health promotion, awareness raising and community dialogue need to be accompanied by interpersonal interventions to help users quit. The 2010 Global Youth Tobacco survey conducted in Guyana found:

1) that 20.9% of students ages 13-15 were current users of tobacco products

2) Second hand smoke (SHS) is high- over three in ten students live in homes where others smoke and more than a half of the students are exposed to smoke around others outside of the home
3) Almost three quarters of the students think smoking should be banned

4) Over four in five current smokers want to quit

The WHO Framework Convention on Tobacco Control (FCTC)\textsuperscript{xxvi} Guyana ratified the FCTC in 2005 by accession. Legislation has been drafted awaiting further public consultation. This legislation falls short of addressing the issue of taxation but addresses the five other aspects of the FCTC MPOWER package. The MPOWER package is a set of six tobacco control measures that are based on the FCTC:

**MPOWER**

M - Monitor tobacco prevalence, impact of policies and tobacco industry marketing and lobbying

P - Protect from second hand smoke: Guyana has adopted this without the supporting Legislation: the population is protected from exposure to second-hand smoke in all health-care facilities and educational facilities, not including universities.

O - Offer help to quit. Tobacco cessation program, including nicotine replacement therapy, and counseling are not yet readily available however opportunities exist for the procurement of Zyban, nicotine patches and bupropion to help

W - Warn of the dangers- Pictoral warnings on <50% of cigarette packages. Public Education programmes on the addictiveness of tobacco and dangers of its use Graphic posters and pamphlets on the effect of tobacco on the body developed and disseminated. While Guyana is required by law to include health warnings on tobacco product packaging, the warnings are not consistent with the recommendations of the WHO FCTC and its implementation guides.

E - Enforce ban on tobacco advertisement, promotion and sponsorship, Labelling Standards were drafted however they have failed to be taken to Parliament for final approval.

R - Raise taxes on tobacco to 75% of retail price. A 70% increase in price will prevent 25% of tobacco deaths.\textsuperscript{xxvii} Taxation is deemed to be the single most effective way to reduce the demand for smoking and consequently, the effect of second hand smoke. In Guyana the tax on the most sold brand of cigarettes is 27% of the retail
price. The price of cigarettes in Guyana in USD is lower than the region’s average (USD 2.30), and the portion of the price composed of taxes is also lower than the region’s average (46%)\textsuperscript{xviii}.

### Alcohol Use

Many of the negative consequences of alcohol use are alcohol-related accidents, injuries, homicides, suicides, lower inhibitions, increased impulsivity, alcohol dependence and poisoning. Alcohol mis-use among youth can contribute to risky sexual behavior, early initiation of sexual behavior, multiple sexual partners, inconsistent condom use and transactional sex\textsuperscript{xxix}. Data from the Guyana physical activity survey reported that 43.6% of the overall population consumed alcohol, with significantly more male drinkers than female (73% vs. 28%). Harmful drinking habits are on the rise among adolescents and other youth\textsuperscript{xxx}. Among adolescents, 2.1% regularly and 32% occasionally drank alcohol. 79% of school children had their first drink before age 14.

There isn’t data readily available on the prevalence of alcoholism in Guyana. However it is estimated that consumption in Guyana is 9.5 liters per capita- higher than WHO’s average of 8.7 for this region. Cultural practices such as the Friday night binge drinking and bar hopping contribute to the high incidence of road accidents. The Valencia Project study on emergency room admissions, injuries and alcohol found that the proportion of victims of non-fatal injuries with alcohol intoxication was 17%; males 21.6% > females 5.2%; men were four times more likely to be involved in injuries than their female counterparts. The study found that 50% of the time, when females in romantic relationships reported acts of violence, one or both partners had been drinking.

To summarize the short falls in the response to the challenge of alcohol misuse:

- Inconsistent efforts to enforce anti-drinking and driving laws
- Inadequate inter-sectoral collaboration.
- Inadequate health promotion and prevention strategies.
- Inadequate treatment facilities and trained personnel for effective rehabilitation.
- Poor data collection

**Environmental and Socio-economic Factors**

The ability to attain the best level of health is influenced by income, education level, living conditions such as access to clean potable water, sanitation, the political climate and access to affordable, acceptable, quality health services and nutritious food. The Government of Guyana provides free health services to all, however there are geographic variations in the availability of some public health services. A person living in the remote regions of Guyana would have limited access to potable water, proper sanitation or specialized medical services. Ethnicity, differences in cultural practices and gender roles also contribute to observed discrepancies in health status across population groups.

Lack of access to refrigeration in the hinterland requires populations to continue to use traditional methods for meat and food preservation which includes the salting and smoking of meats. Food traditionally prepared using coal fires which women as against men are exposed to several times per day for hours per day. The health effects of this lifestyle on women needs to be further studied to see if there is a link to increased risk for lung cancer or chronic lung diseases.

Additionally, cultural practices that encourage early sexual debut and multiple sexual partners have been associated with the relatively high mortality and morbidity rates for cervical cancer in the hinterland locations. Chances for early detection of cervical cancer in the hinterlands are limited in comparison regions 4 or 6 and therefore survival rates after diagnosis are also less.

Around two-thirds of households in urban areas are in the two highest wealth quintiles compared with about one-third in rural areas. In contrast, households in rural areas are five times as likely as those in urban areas to be in the poorest wealth quintile (26 percent versus 5 percent).
Guyana is in the process of decentralizing the administration and delivery of health services through the contraction of Regional Health Authorities (RHA). RHAs are well positioned to know the local health needs of the people and are therefore readily able to deliver them.

The Government is striving towards establishing more RHAs to reduce inter-regional inequity in health. Equity in access to health services needs to be assured. For example, in regions where high incidence and mortality rates of cervical cancer are observed, vaginal inspection using acetic acid (VIA) screening for the early detection and HPV vaccination for prevention need to be readily accessible and promoted.

The Government needs to provide the citizens of Guyana with job security which in turn fosters dignity and self worth. Unemployment and underemployment make the attainment of optimal health and attendance to school and work problematic. Poverty erodes health and poor health feeds poverty. Regions 1, 8, and 9 have most of their households in the lowest quintile (72, 74, and 84 percent, respectively), while Regions 4 and 10 have a significant percentage of households in the wealthiest quintile (32 and 24 percent respectively).

Various population-based health promotion and risk awareness raising campaigns have been utilized to change risk taking behaviors. Mass media advertisements have been accompanied by supporting inter-personal communication materials such as brochures and pamphlets that are distributed at health fairs, during out-reach efforts and community health talks and edutainment. These interventions have to be evaluated for their effectiveness in changing behaviors and reaching those most in need.

CARMEN
In November 2007, Caribbean countries decided to request Ministers of Health to all join CARMEN- acronym “Collaborative Action for Risk Factor Reduction and Effective Management of NCDs”. The network seeks to implement projects to support the Chronic Disease Regional Strategy; define tools/methodologies to support CARMEN initiatives at country level and to deepen the sense of joint collaborative commitment among PAHO, countries, and partners towards implementing the Chronic Disease Regional Strategy.

In 2009, the Caribbean Sub-region outlined the following as priorities:
1. Support for the design and development of National Commissions
2. Support for development Tobacco Legislation for implementation in countries
3. Development of an integrated approach to NCDs, mainstreaming surveillance and other actions within the health care model
4. Capacity development for resource mobilization with the emphasis on Grants

Regional Institutions providing support to countries:
- Caribbean Epidemiological Research Centre (CAREC): Public Health Surveillance, applied research, training, information warehousing/ databases; specific support to Cervical cancer
- Caribbean Food and Nutrition Institute (CFNI): Regional, collaborative approaches to solving the nutrition challenges in the Caribbean - enhance, describe, manage and prevent the key nutritional problems and to increase their capacity for food security and optimal nutritional health using nutritional surveillance, policy and inter-sectoral work with Agriculture, Education, and others, information, training and applied research.
- Caribbean Health Research Centre (CHRC): Coordinating research, advocacy
- CRDTL Caribbean Regional Drug Testing Laboratory
- CEHI Caribbean Environmental Health Institution
(The five agencies above are being merged into CARPHA, the Caribbean Regional Public Health Authority)

- University West Indies; Chronic Disease Research Center, (CDRC), UWI Barbados: conducting research, training, advocacy
- CARICOM Secretariat: policy especially inter-sectoral approaches, e.g., trade policy currently negotiated by CRNM, resource mobilization
- PAHO/WHO: normative roles, surveillance, capacity building, applied research, resource mobilization, advocacy with other UN and international partners, CCH joint coordination with CARICOM

**NCD Summit**

The Caribbean is in the unique position of having a mandate from their Heads of Government for inter-sectoral work to combat the NCD epidemic. Since the CARICOM summit in September 2007, inter-sectoral NCD summits have been held and national commissions launched in several countries. The 16th meeting of the CARICOM Ministers Council on Human and Social Development (COHSOD) on Children and Development (April 2008), and COHSOD 17 on the Implementation Agenda on Education (October 2008) adopted relevant elements of the Port of Spain Declaration for implementation by the respective sectors. In addition, the successful region-wide, inter-sectoral celebrations of Caribbean Wellness Day 2008 have set the stage for scaling up activities in regard to the NCDs.

**PARTNERSHIPS**

In keeping with the recommendations from the PAHO regional Strategy for NCDs, this strategy will focus on community interventions that build supportive environments for risk-factor reduction, mobilize communities to change institutional policies, and to become active participants in the creation of enabling environments.

Addressing NCDs requires the collaboration of civil society, the private sector, government, regional and international organizations and individual community residents
to bring action to bear on the broad determinants of these diseases. Since the CARICOM Heads of Government Summit on NCDs, partnerships have been enhanced.

**Civil Society and Private Sector:**

The Ministry of Health has named as partners:

- Ministry of Agriculture
- Ministry of Culture Youth and Sport
- Ministry of Labor, Human Services and Social Security
- Ministry of Education
- Ministry of Regional and Local Government
- Ministry of Housing
- University of Guyana
- Media Association
- Private Sector
- Faith Based Organizations
- Guyana Association of Medical Laboratory Professionals
- Cancer Society, Cancer Institute, Periwinkle Society
- Guyana Kidney Foundation,
- The Guyana Diabetes Association,
- The Guyana Sickle cell Association
- Other Community Based Organizations across Guyana

**Private and NGO Health Sector**

The majority of primary care is delivered through public medical practitioners. The private sector provides a smaller but significant portion of health services. Private pharmacies, laboratories and other health and wellness services form part of the network of Guyana’s health system. Collaboration with these important partners needs to be developed and enhanced.
Government:

The Minister of Health recognizing the multi-sectoral factors in the NCD epidemic, undertakes to support the various government ministries and agencies with developing clear objectives, priorities and time-tables for the actions required, and determine a reporting mechanism with milestones.

Government priorities in support of NCD prevention and control are:

- Fiscal and tax policies
- New legislation (especially tobacco legislation) and enforcing existing legislation;
- Review of policies and programs to improve the built environment which significantly impact health risks of inactivity, pollution, stress and road traffic accidents;
- Strengthen the coordination and management mechanisms between government agencies.
- Establish inter-sectoral National Commissions, the leadership mechanism for the POS Declaration, including representatives from the private sector and civil society

Prevention and Control of NCDs

Guyana is intensifying its population based health promotion efforts encouraging primary prevention through the adoption of healthy lifestyles. Quality improvement of primary care services is being actualized through the development of guidelines and standards, quality assurance committees that conduct regular facility and procedural inspections towards licensing. The seven established regional Diabetes and Foot Care Centers provide a solid base on which to integrate cardiovascular, lipid profile, kidney function screening and management and screening for cancer.
In keeping with recommendations from WHO and the Port of Spain Declaration, Guyana is proposing combining a population based and a high-risk individual approach for the prevention and control of chronic diseases.

**WHO:** “Small shifts throughout the range and accompanying reductions in the mean population levels of several risk factors are likely to be more effective in reducing the incidence of disease than approaches targeted to people with elevated levels of those risk factors or people who meet diagnostic criteria for hypercholesterolemia hypertension, obesity or diabetes.”
NATIONAL STRATEGY AND ACTION PLAN FOR THE PREVENTION AND CONTROL OF CHRONIC DISEASES

The Guyana National Strategy for the prevention and the Control of Chronic Diseases is based on the directives and orientations of the Regional Strategy, which established 5 lines of action:

1. Risk factor reduction and Health Promotion
2. Integrated Disease Management and Patient Self-Management Education
3. Surveillance, Monitoring and Evaluation
4. Public Policy, Advocacy and Communication
5. Programme Management

This strategy recommends the use of population based as well as high risk individual based interventions to reduce the incidence of NCDs.

Framework for Action

The Strategy incorporates some of the concepts and themes from the following WHO and PAHO resolutions:

- the WHO Global Strategy for the Prevention and Control of Chronic Diseases 2008-2013
- Regional Strategy for NCD prevention and control 2012-2025
- Strategic Plan of Action for the Prevention and Control of Non-communicable Diseases in the Caribbean Community 2011-2015

PAHO/WHO

- Caribbean Cooperation in Health Phase III (CCH III) 2010-2015
- Cardiovascular Disease, especially Hypertension (CD42.R9, 2000);
- Framework Convention for Tobacco Control (WHA56.1, 2003);
- Global Strategy on Diet, Physical Activity, and Health (WHA57.17, 2004);
- Cancer Prevention and Control (WHA58.22, 2005).
In addition, this strategy is consistent with the obesity prevention strategies laid out in the International Obesity Task Force and the Regional Strategy on Nutrition and Development.

**Quality, Client- centered Prevention and Primary Care Services**

- Client motivated to access health services and assume shared control for primary or secondary prevention
- Community based sports, music drama and health education
- Mass media, Reality TV health promotion in schools, work place & churches. Social media eg facebook, Twitter

**The Guyana Chronic care model** - ease of access to high quality primary care services provided by a multi-disciplinary team operating in a supportive environment that includes community participation in health.
Priority Action 1: RISK FACTOR REDUCTION, HEALTH PROMOTION AND DISEASE PREVENTION

The life course perspective is considered in this strategy and recognizes the environmental, economic and social factors, and the consequential behavioral and biological processes that act across all stages of life to affect disease risk. The objective of this strategy is to promote social and economic conditions that address the determinants of chronic diseases and empower people to adopt healthy behaviors. Health promotion is a fundamental part of an integrated approach for chronic disease prevention and control.

This strategy incorporates some of the concepts and themes from Health Promotion: Achievements and lessons learned from Ottawa to Bangkok (CE138/16). This strategy supports the Ottawa Charter’s call to prioritize health promotion and empower individuals and communities to exercise greater control over their health status and social determinants. This plan proposes the following to address the needs for health promotion, particularly to promote healthy diets, physical activity and tobacco, alcohol and other drug demand reduction.

- the promotion and adoption of healthy dietary habits, active lifestyles, and the control of obesity and nutrition-related chronic diseases;
- the development of public policies, guidelines, institutional changes, communication strategies, and research related to diet, physical activity, alcohol and tobacco use;
- health promotion and disease prevention strategies;
- a life course perspective that considers health starting with fetal development and continuing into old age; and
- The concerted effort of multiple partners from the health and health-related sectors.

Primary prevention is best achieved through risk factor identification and reduction.
Routine preventive health exams in primary care settings are a recommended approach for chronic disease prevention. **Wellness Centers of Excellence** will be identified and branded to attest to the provision of services that reach national quality standards. These services will include screening for risk factors:

- blood pressure measurement
- ECG testing and interpretation;
- calculation of body-mass index or simple waist measurement (which research out of the Tropical Medicine Research Institute (TMRI) in Jamaica suggests is equally as effective and less complex)\(^{xxxiii}\)
- lipid profile testing
- blood glucose testing, including HBA1C
- 60 second screening for risk for diabetic foot ulcers and the use of monofilament foot testing according to IIWCC (International Inter-professional wound Care Committee) standards
- screening for cervical cancer using Visual Inspection using Acetic Acid (VIA) or Pap tests and referral as needed
- screening for breast cancer and referral for further investigation
- screening for prostate and colorectal cancer.
- Referral of hypertensive and diabetic patients for annual eye exams and fundoscopy
- Screening and/or monitoring of kidney function tests especially in the diabetic, hypertensive and renal failure patients.
- Timely referral to tertiary level and/or wrap-around services when appropriate
- Space for exercising
- Screening for sickle cell anemia
Health promotion will take place at the population, community and individual level and will be culturally appropriate based on the profile of the sub-population targeted.

Interventions will include:

- Community-based interventions – Caribbean Wellness Promotion for one month
- School-based interventions – PE from primary through secondary schools, inter-school debating competitions or quiz on NCDs, health talks and screenings
- Faith-based organizations - Health talks and screenings
- Male dominated institutions such as the Lodge, Guysuco.
- Work place interventions - PA promotion, screening, nutrition and competition. Health goals will be set for individuals at each work site and inter-agency competitions will be held
- Individuals will be motivated to take charge of their health by being proactive in seeking health services
- National media campaigns – ads on TV and radio stations, infomercials developed for TV and waiting rooms. Reality TV shows highlighting life with a chronic disease and the journey to better health, face-book and Twitter will be utilized to gain public awareness and buy-in.
- Gender sensitive programs and behavioral change interventions will be developed based on information garnered from research on how gender roles affect risk for NCDs
- Mass media, institutional and interpersonal communication to raise awareness on measures to eliminate the risk for sickle cell disease.

**Priority Action 2: INTEGRATED MANAGEMENT OF CHRONIC DISEASES AND RISK FACTORS**

The present primary health care model has not proven successful in dealing with prevention and management of chronic conditions. An inter-sectoral approach and a reorientation of the health care system are essential for successful chronic disease
programs. It is necessary to improve the accessibility, acceptability and availability of services and essential medicines. Multidisciplinary health teams with the relevant skill mix will be established at regional “Wellness Centers of Excellence” which will be established to reduce social, economic, and cultural barriers to accessing health services, particularly among more vulnerable populations.

Brand for Wellness Centers of Excellence- encompass all of the services of the Regional Diabetes and Foot care Centers “and some.” This strategy recognizes that prevention and management of chronic diseases requires integration through strengthened referrals and feedback among primary, secondary, and tertiary levels of care. The entire spectrum of disease management from screening and early detection, to diagnosis, treatment, rehabilitation, and palliative care is necessary. The constructs of the Chronic Care Model are incorporated into the objective for the management of chronic diseases and risk factors, and are intended to improve outcomes in five areas. These areas are as follows:

- a coherent approach to system improvement,
- development and adherence to guidelines,
- Self-management support for people with chronic diseases,
- improved clinical information systems,
- Appropriate skill mix and improved technical competency of the health workforce, including cultural competence and sensitivity.

**Integrated Disease Management and Patient Empowerment:**

There will be a re-orientation of health care providers towards the provision of patient-centered care where the needs of the patient drive the delivery of individualized care and treatment plans.

- Primary care doctors, medex, nurses and community health workers based in at least 50 facilities will be trained to manage and care for diabetes, hypertension, chronic renal failure due to HTN, sickle cell anemia and
DM and CVDs according to national guidelines. A team approach to holistic case management will be deployed.

- NCD sites will facilitate the screening of at-risk diabetic patients for TB
- A cadre of master trainers will be used for on-going health worker training and to provide health talks during outreach or screening exercises.
- Through on-going sensitization and policy development, health provider orientation will undergo a paradigm shift to becoming more client- and service-centered
- Protocols and guidelines for client management on arrival at health facilities will be developed whether in primary care settings, acute care or hospital in-patient management
- Prompt referral of cancer cases to specialized clinics will be promoted
- Government will leverage provisions of the CCH III to enter agreements with CARICOM member states to share limited human resources in demand, e.g. endocrinologists and oncologists.
- Capacity will be built to provide quality laboratory services at Regional Hospitals. Provisions will be made to provide access to HBA1c, lipid profile, ECG and blood glucose testing in support for NCDs
- Patient education and empowerment towards self management
- Community mobilization to create a supportive environment for the adoption and maintenance of risk reducing behaviors
- Treatment passports that chronicle treatment for reference
- Behavior change communication materials using video and print materials
- Supervisory mechanisms will be built for the attainment and maintenance of national standards
- Improved access to essential medicines and technologies
- Regional Health services will ensure an adequate budget will be assigned to NCDs at RHAs and Regional facilities
- Stronger collaboration with the Ministry of local government to ensure relevant infrastructure and equipment are available
➢ Partnerships with private sector providers to supplement health care services under an agreed upon MoU.

The Chronic Disease department of the Ministry of Health will collaborate with the National Tuberculosis Program to implement the WHO recommended protocol for the screening of persons with diabetes at chronic care facilities. This initiative will boost the identification of TB among people with diabetes and also TB infection control will be strengthened at these facilities. The National Tuberculosis Program will continue to screen patients with TB for DM at TB treatment sites.

This Strategy recognizes the call for a renewed approach to primary health care and the highest attainable level of health for everyone as emphasized in the Regional Declaration on the New Orientations for Primary Health Care (promulgated at the 46th Directing Council). Also reflected in this plan is Resolution CD45.R7 which prioritizes access to medicine and other health supplies. The organization of the delivery of limited primary care services will reflect the profile of the particular sub-population or region. For example regions with high incidence of cervical access must have ready access to VIA screening and HPV vaccination.

**Priority Action 3: SURVEILLANCE**

Chronic Disease’s surveillance includes the on-going, systematic collection, review and analysis of data. This data is in turn translated into useful information before timely dissemination to key stakeholders to facilitate its use for planning and programme modifications. Surveillance also serves to collect information on the knowledge, attitudes and behaviors of the public with respect to practices that prevent these illnesses, facilitate screening and guide the activities about Information, Education and communication in order to improve quality of life.
Surveillance of chronic diseases detects the change in the prevalence of these disorders and will be carried out through the monthly reports from the health units and the selected sentinel sites. The sub-surveillance system for the Non-communicable Diseases will be linked to the National Sanitary Surveillance System. Surveillance of chronic Non-communicable Diseases will help the formulation of policies and planning of the strategies for health promotion and sanitary education for the prevention or the delay in the onset of chronic disorders.

**Components of the Surveillance System for Non-communicable Diseases:**

- Mortality from Non-communicable Diseases
- Morbidity from Non-communicable Diseases
- Risk Factor Surveillance using WHO/PAHO STEPS and programmatic data

**Mortality:**

Mortality caused by Non-communicable Diseases or their complications will be monitored through the reports of mortality from:

- Cerebro-vascular Diseases
- Cardiovascular Diseases
- Cancer
- Diabetes Mellitus
- Asthma
- Sickle cell Disease

**Morbidity:**

Morbidity will be monitored through the number of people admitted to hospitals and attending the outpatient services for NCDs. A chronic disease register will be created with a corresponding patient linked database to capture risk behaviors, diseases and complications.

**Targeted diseases:**

- Cardio- and Cerebro-vascular diseases
- Diabetes Mellitus
- Chronic Respiratory Diseases
- Cancer
- Sickle cell Disease

Also included within the surveillance system, will be the collection of data on the frequency of complications produced by these diseases, such as: strokes, ischemic heart disease, amputations, retinopathies, renal insufficiency, ‘pulmonary fibrosis, neuropathies’ and annual reporting for minimum data sets. The general aim is for the stabilization of the prevalence of NCDs by 2017, recognizing that with increased screening incidence will increase initially and with better management, prevalence will also increase. Guyana aims to decrease the mortality due to NCDs by 25% by 2025.

**Risk Factors Surveillance**
Risk factor prevalence will be established via a national survey. The first such survey will provide the baseline population data. The PAHO STEPS model will be used to gather data on behavioral risk factors, anthropometrics and biochemical status. Volunteers from partnering organizations such as Red Cross, Rotary and students of the University of Guyana will execute this survey under the management of Ministry of Health. This survey provides a mechanism for early detection of risk factors and NCDs and an opportunity for entry into the health system for management. Once the national baseline data is collected, monitoring of the risk factors will commence at the sentinel sites. Surveillance of risk factors will be achieved through monitoring of trends from risk factor surveys repeated every 3-5 years and routine programmatic data from the NCD register that will be created.

**PRIORITY ACTION 4: PUBLIC POLICY AND ADVOCACY**
- Laws and Regulations- Anti-drinking and driving, PA in all schools, community recreational spaces, policies that facilitate pregnant girls completing a formal secondary school education
- Tax and Price Interventions- Tobacco taxation and taxation on unhealthy foods such as those high in trans fats, increased taxation on alcoholic beverages
- Participation of Private Sector and community based organizations in the response to NCDs
- All MoH service delivery programs especially maternal and child health, tuberculosis and HIV integrate NCD sensitization, screening and management and referral into their program protocols.

The objective of public Policy and Advocacy is to ensure and promote the development and implementation of effective, integrated, sustainable, and evidence-based public policies on chronic disease, their risk factors and determinants. The re-creation of a National Commission that includes an interdisciplinary advisory group will be a necessary initial step for the implementation of the National Program for the Prevention and Control of Chronic Diseases. The Commission would ensure multi-sectoral policies and work plans that facilitate wider stakeholder participation and accountability in strategies to address NCDs.

In various countries, many policies, laws, and regulations adopted have been successful in preventing or reducing the burden of disease and injury, such as tobacco taxation and the use of seat belts and helmets, yet several countries in LAC have no policies or plans to combat chronic diseases and their risk factors. Other examples have been legislation to decrease salt content in processed foods, plus appropriate labeling and enforcement, and legislation and health education to reduce cholesterol into the foods.

Environmental and multi-sectoral interventions are effective, for example, it has been demonstrated that replacing the 2% of energy that comes from trans-fat with polyunsaturated fat would reduce cardiovascular disease by 7% to 40% and would also reduce type 2 diabetes. Because trans-fat could be eliminated or significantly reduced by voluntary industry action, legislation that mandates reduced trans-fat and salt content in manufactured foods is a good intervention. With such legislation in place, the government would need the capacity to test nutritional content of food. The possibility exists through the CCHIII mechanism, to facilitate food content testing for the Guyana at CARPHA. Such policy change would be accompanied by population-, community-, work
place-, school- and health facility- based education campaigns to reduce the demand for foods high in salt and trans-fat. The Government of Guyana will develop a policy requiring fast food establishments to post the caloric content of menus in full view of customers. The NCD strategy will facilitate partnerships with fast food establishments to sponsor public health events such as walk-a-thons and health fairs as part of their social marketing efforts.

The NCD Commission will provide oversight to the finalization and implementation of school canteen and nutrition policy, and policies that facilitate physical education being time tabled at every school- from nursery to secondary. The commission will provide a forum for greater inter-sectoral collaboration for community; school and work place based physical activity and health education policies and programs.

Guyana will table its draft legislation prohibiting the smoking of cigarettes in public places, health care facilities and education facilities. This legislation will protect non-smokers from the dangers of second hand smoke but will not criminalize individuals who choose to smoke “responsibly.” The draft tobacco legislation prohibits the sale of cigarettes to minors. Further legislation prohibiting the sale of alcohol to minors will be promoted by the Ministry of Health. These are effective measures to prevent young persons and children from initiating smoking or drinking. The said draft tobacco legislation stops short of recommending increased taxation on tobacco products. This very measure however has been proven to be most effective in reducing the demand for tobacco and increasing revenue that could be allocated to health promotion efforts. The Ministry will address the need for increased taxation on tobacco products from the current 27% to a minimum of 40% of the retail price. The possibility of raising taxes on alcoholic beverages and mobilizing for the enforcement of anti-drinking and driving laws can be taken up by the NCD Commission and other interest groups.
The Ministry of Agriculture with support from the NCD Commission will also explore the drafting of legislation to prohibit the growth of tobacco in Guyana. The NCD commission will support the Ministry of Local Government, Ministry of Culture Youth and Sport and the Ministry of Housing in drafting and tabling legislation that requires the provision of pavements, community spaces, places and equipment for recreation and exercise when designing or planning new housing schemes. Such facilities will be used to promote not only physical activities such as sports or games, but can facilitate cultural training within the community. For example the Ministry of Culture could facilitate workshops and training in steel pan, other musical instruments and drama. Health education targeting youth and men should also be facilitated through coach and other community leader training. Mobilizing community members to utilize the provided facilities will be required as these communal activities will be competing with television and the internet at home unless the community centers are also equipped with computers and televisions. When young people are thus-wise gainfully engaged it can reduce the incidence of crime and serve to build community cohesion. Physical activity, games and music can also provide stress relief and build social skills.

Finally, the commission will be responsible for the review and updating of archaic National Insurance Scheme Policies (NIS) that for instance do not compensate patients for HbA1C testing, nor compensates diabetic patients for the purchase of personal glucometers or strips. There is need for the development of a policy that will require all new-bornes to be screened for sickle cell anemia and parents educated on the implications of having a child with sickle cell trait or disease. This should be done in an effort to increase the number of persons who are aware of having sickle cell trait and the measures they can take to prevent their off-spring from having the disease.
Priority Action 5: Program Management

PARTNERSHIPS AND COORDINATION Collaborative relations between the Ministry of Health and the Ministry of Local Government will be built on to co-opt existing Regional Health Authorities and Regional Health Services into the NCD Commission. The effective implementation of the NCD strategy will be achieved through the creation of strategic partnerships between ministries of government, the private sector and community based organizations. Moreover, the formation of a governing, cabinet appointed, NCD commission will mark government’s commitment to ensuring a policy framework is in place to ensure support, technical assistance, financial allocations and accountability for all participating entities- whether CBO, FBO, private sector or ministry. The commission will report directly to the Minister of Health and the NCD coordinator will serve as the secretary. Each ministry will be required to appoint a focal point and health committee- which in some instances may coincide with an occupational health department. The Commission, through its implementing ministerial committees and focal points will provide technical oversight, fiscal accountability, resource mobilization, training and monitoring and evaluation. Within schools, community based sports clubs, churches and work places, health, nutrition and physical activity programs will be implemented and quarterly reports submitted to the NCD committee. The theme for each year, the area of focus, the coordination of activities and the distribution of resources will be managed by the NCD commission through respective NCD committees.

RESOURCE MOBILIZATION / HEALTH FINANCING Memoranda of Understanding (MOU) will be developed for NGO/CBO and partnering ministries. The Ministries of Education, Culture Youth and Sports and Health will ensure plans of action and budgetary allocations are made to provide NGOs/CBO with subversions to implement programs on their behalf.
Primary care and chronic diseases clinics within the regions will be equipped with requisite pharmaceuticals, machinery and supplies to provide commensurate quality services whether within Regional and District Hospitals, or at health centers and health posts. Resource mobilization for structural refurbishment, branding and upgrades will be undertaken in collaboration with the Regional Health Services Unit and the Ministry of Local Government.

**PHARMACEUTICALS AND EQUIPMENT**

Pharmaceuticals to support smoking cessation and to treat dyslipidemia will be procured in sufficient quantities to support the expectant increase in demand due to surveillance and health promotion. Regions will be strategically grouped to facilitate access to such laboratory tests as lipid profile, HbA1C, blood glucose, Hb, kidney and liver function testing. A system for sample collection, transportation and testing with subsequent reporting will be developed or refined. Similarly, regional grouping patterned after the administrative RHAs will lend to resource sharing and efficiency.
Annex 1: PLAN OF ACTION FOR PREVENTION AND CONTROL OF CHRONIC DISEASES AND THEIR RISK FACTORS

GOAL: TO PREVENT AND REDUCE THE BURDEN OF CHRONIC DISEASES AND RELATED RISK FACTORS IN GUYANA

PRIORITY ACTION 1: RISK FACTOR REDUCTION AND HEALTH PROMOTION

**OBJECTIVE:** To foster, support and promote the conditions that enable Guyanese to adopt healthy behaviors especially healthy eating, active living, tobacco and alcohol control with the aim to reduce the incidence of NCDs by 20% by 2020

**Expected Result:** Population-based strategies and interventions for risk factor reduction improved to facilitate a health promoting environment in which people practice healthy behaviors, including promotion of healthy diets and physical activity, no tobacco and no harmful use of alcohol

DECLARATION OF PORT-OF-
SPAIN:

UNITING TO STOP THE EPIDEMIC OF

CHRONIC NCDs

We, the Heads of Government of the Caribbean Community (CARICOM), meeting at the Crowne Plaza Hotel, Port-of-Spain, Trinidad and Tobago on 15 September 2007 on the occasion of a special Regional Summit on Chronic Non-communicable Diseases (NCDs);

Conscious of the collective actions which have in the past fuelled regional integration, the goal of which is to enhance the well-being of the citizens of our countries;

Recalling the Nassau Declaration (2001), that “the health of the Region is the wealth of Region”, which underscored the importance of health to development;

Inspired by the successes of our joint and several efforts that resulted in the Caribbean being the first Region in the world to eradicate poliomyelitis and measles;

Affirming the main recommendations of the Caribbean Commission on Health and Development which included strategies to prevent and control heart disease, stroke, diabetes, hypertension, obesity and cancer in the Region by addressing their causal risk factors of unhealthy diets, physical inactivity, tobacco use and alcohol abuse and strengthening our health services;

Impelled by a determination to reduce the suffering and burdens caused by NCDs on the citizens of our Region which is the one worst affected in the Americas;

Fully convinced that the burdens of NCDs can be reduced by comprehensive and integrated preventive and control strategies at the individual, family, community, national and regional levels and through collaborative programmes, partnerships and policies supported by governments, private sectors, NGOs and our other social, regional and international partners;

Declare –

1. Our full support for the initiatives and mechanisms aimed at strengthening regional health institutions, to provide critical leadership required for implementing our agreed strategies for the reduction of the burden of Chronic, Non-communicable Diseases as a central priority of the Caribbean Cooperation in Health Initiative Phase III (CCH III), being coordinated by the CARICOM Secretariat, with able support from the Pan American Health Organisation/World Health Organisation (PAHO/WHO) and other relevant partners;

2. That we strongly encourage the establishment of National Commissions on NCDs or analogous bodies to plan and coordinate the comprehensive prevention and control of chronic NCDs;

3. Our commitment to pursue immediately a legislative agenda for passage of the legal provisions related to the International Framework Convention on Tobacco Control; urge its immediate ratification in all States which have not already done so and support the immediate enactment of legislation to limit or eliminate smoking in public places, ban the sale, advertising and promotion of tobacco products to children, insist on effective warning labels and introduce such fiscal measures as will reduce accessibility of tobacco;

4. That public revenue derived from tobacco, alcohol or other such products should be employed, inter alia for preventing chronic NCDs, promoting health and supporting the work of the Commissions;

5. That our Ministries of Health, in collaboration with other sectors, will establish by mid-2008 comprehensive plans for the screening and management of chronic diseases and risk factors so that by 2012, 80% of people with NCDs
would receive quality care and have access to preventive education based on regional guidelines;
6. That we will mandate the re-introduction of physical education in our schools where necessary, provide incentives and resources to effect this policy and ensure that our education sectors promote programmes aimed at providing healthy school meals and promoting healthy eating;
7. Our endorsement of the efforts of the Caribbean Food and Nutrition Institute (CFNI), Caribbean Agricultural Research and Development Institute (CARDI) and the regional inter-governmental agencies to enhance food security and our strong support for the elimination of trans-fats from the diet of our citizens, using the CFNI as a focal point for providing guidance and public education designed toward this end;
8. Our support for the efforts of the Caribbean Regional Negotiating Machinery (CRNM) to pursue fair trade policies in all international trade negotiations thereby promoting greater use of indigenous agricultural products and foods by our populations and reducing the negative effects of globalisation on our food supply;
9. Our support for mandating the labelling of foods or such measures as are necessary to indicate their nutritional content through the establishment of the appropriate regional capability;
10. That we will promote policies and actions aimed at increasing physical activity in the entire population, e.g. at work sites, through sport, especially mass activities, as vehicles for improving the health of the population and conflict resolution and in this context we commit to increasing adequate public facilities such as parks and other recreational spaces to encourage physical activity by the widest cross-section of our citizens;
11. Our commitment to take account of the gender dimension in all our programmes aimed at the prevention and control of NCDs;
12. That we will provide incentives for comprehensive public education programmes in support of wellness, healthy life-style changes, improved self-management of NCDs and embrace the role of the media as a responsible partner in all our efforts to prevent and control NCDs;
13. That we will establish, as a matter of urgency, the programmes necessary for research and surveillance of the risk factors for NCDs with the support of our Universities and the Caribbean Epidemiology Centre/Pan American Health Organisation (CAREC/PAHO);
14. Our continuing support for CARICOM and PAHO as the joint Secretariat for the Caribbean Cooperation in Health (CCH) Initiative to be the entity responsible for revision of the regional plan for the prevention and control of NCDs, and the monitoring and evaluation of this Declaration.

We hereby declare the second Saturday in September “Caribbean Wellness Day,” in commemoration of this landmark Summit.
