

The **2010 Oman GSHS** measured dietary behaviors; hygiene; physical activity; protective factors; and violence and unintentional injury.

The Oman GSHS was a school-based survey of students in grades 8th, 9th, or 10th. A two-stage cluster sample design was used to produce data representative of all students in grades 8th, 9th, or 10th in Oman. At the first stage, schools were selected with probability proportional to enrollment size. At the second stage, classes were randomly selected and all students in selected classes were eligible to participate. The school response rate was 94%, the student response rate was 94%, and the overall response rate was 89%. A total of 1606 students participated in the Oman GSHS. Students self-reported their responses to each question on a computer scannable answer sheet. For comparison purposes, only students aged 13-15 years are included in the analyses for this fact sheet.
