**KENYA STEPwise SURVEY
FOR NON COMMUNICABLE DISEASES
RISK FACTORS 2015 REPORT**

TABLE OF CONTENTS

TABLE OF CONTENTS.....	ii
List of Tables	iv
List of Figures	xv
List of Contributors	xvi
List of Acronyms and Abbreviations	xvii
Foreword	xviii
Preface	xviii
Executive summary	xix
Acknowledgments.....	xxiv
CHAPTER ONE: INTRODUCTION.....	2
Kenya Country Profile	2
Geographical and Governance structure.....	2
Geographical structure	2
Coastal Region	2
Southern Coastal Hinterland	2
The Eastern Plateau.....	2
Northern Region	3
Highlands Region.....	3
Rift Valley Region	3
Western Plateau Region	3
Climate.....	3
Vegetation.....	4
Drainage System	4
Governance Structure	4
Devolved Governments	5
The Economy	5
The Population	6
Social Services, Health Policy, and Health Status.....	7
Social Services	7
Health Policy	7
Health Status	8
Health Sector Financial Allocations and Expenditure	8
Non-communicable Diseases	8
The Burden of NCDs.....	9
NCDs in Kenya.....	9
Non communicable diseases prevention and control	12

CHAPTER 2 SURVEY METHODS AND OPERATIONS	14
2.1 Survey Rationale and Objectives.....	15
2.2 Survey Sampling and Methodology	16
2.2.1 Sample Size and Eligibility	16
2.2.2 Survey Tools and Structure.....	16
2.2.3 Ethical Consideration	17
Survey Administration.....	18
Training of Data Collectors	18
Fieldwork.....	18
2.3.2.1 Electronic Data Collection.....	19
2.3.2.2 Data Quality Management	19
2.3.2.3 Logistical Challenges/Limitations	20
2.4 Data Management.....	21
2.4.1 Weighting of Data	21
2.4.2 Data Analysis	21
2.4.3 Analysis and Report writing.....	21
CHAPTER 3: SURVEY RESULTS.....	22
3.1 Response rate	23
3.2 Characteristics of the Survey Respondents.....	23
3.3 Behavioral Risk factors	27
3.3.1 Tobacco Use	27
3.3.2 Alcohol Consumption	35
3.3.3 Diet.....	42
3.3.4 Physical Activity	58
3.4 Past Medical History	71
3.5 Cervical Cancer.....	80
3.6 Primary Source of Health Care	83
3.7 Healthy Lifestyle Advice	84
3.8 Physical Measurement.....	85
3.9 Biochemical Measurement.....	93
3.10 Combined risk factors	97
3.11 Injuries.....	98
3.12 Oral Health.....	109
CHAPTER 4: DISCUSSION AND CONCLUSIONS	121
CHAPTER 5: POLICY IMPLICATIONS AND RECOMMENDATIONS	128
CHAPTER 6: BIBLIOGRAPHY	131
APPENDIX A - SAMPLE DESIGN FOR THE 2015 STEPS SURVEY	135
APPENDIX B Additional Tables.....	140
APPENDIX C Questionnaire.....	153
APPENDIX D. PERSONS INVOLVED IN THE 2015 KENYA STEPWise Survey for NCD Risk factors	179

Foreword

This report presents the findings of the Kenya STEPwise survey for non communicable diseases (NCD) risk factors 2015. The Kenya STEPs survey is the first nationally representative survey to collect comprehensive information on risk factors for NCDs and Injuries.

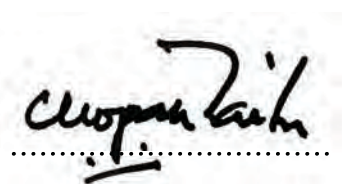

Kenya is experiencing an epidemiological transition in its diseases burden from infectious to non-communicable conditions resulting in a double burden of disease. Non communicable diseases are a major public health concern with significant social and economic implications in terms of health care-needs, lost productivity and premature death. NCDs are thus a serious setback to our attainment of social, health and economic targets if no proper interventions are put in place. This report provides the very essential information to inform policy geared towards halting and reversing this burden of non-communicable diseases.

The report gives a brief of the burden of NCD both globally and in Kenya. The report includes statistics on NCD risk factors, injuries and oral health among adults age 18-69, which will serve as an evidence base to strengthen NCD prevention and control initiatives in the country. It will also serve as an authoritative reference source for policymakers, stakeholders, public health professionals, and others concerned with NCD control in Kenya.

Implementing the Kenya STEPS survey required wide stakeholder engagement, in-depth literature review and dedication from the technical working group that undertook the planning and implementation phases of the survey. The hard work and determination of the STEPS field teams additionally allowed this vital activity to run smoothly to completion. We owe each of them our sincere appreciation.

The Ministry of Health is grateful to the World Health Organization (WHO) for the technical assistance. We are equally grateful for the generous funding from World Bank, CDC and the WHO that enabled us to complete this important activity. The technical expertise given by the Kenya National Bureau of Statistics was very key for this survey and is appreciated.

The STEP survey results demonstrate the big challenge that NCDs present to our nation and both the strengths and challenges of Kenya's response to NCD, Injuries and Oral Health. In line with the multi-sectoral nature of the NCD determinants, I call on all state and non-state actors to partner with the ministry of health to embrace this report as a call to action and lend us their support towards halting and reversing the burden of Non communicable diseases.

Dr. Cleopa Mailu EBS
Cabinet Secretary
Ministry of health

Preface

Non communicable diseases (NCDs) are a major public health concern with significant social and economic implications in terms of health care needs, lost productivity and premature death. NCDs are thus a serious setback to our attainment of social, health and economic targets.

The WHO STEPwise approach to surveillance of NCD risk factors (STEPS) survey is part of a global surveillance strategy in response to the growing need for country level trends in non communicable diseases and injuries. The aim of this survey is to establish an NCD surveillance platform that collects baseline indicators on determinants of NCD and their risk factors for policy and planning purposes.

The report should be used as a resource to inform the process of planning and policy formulation as well as a monitoring and evaluation tool for NCDs. STEPs Kenya 2015 is fundamentally important as it will provide baseline information which will be used to evaluate future NCD and Injuries prevention and control initiatives.

The Kenya STEPS survey is part of our efforts to address the increasing burden of the NCD epidemic affecting the nation. It marks an increased commitment by the Ministry of Health to tackle the NCD and Injuries challenge and will serve us well in the further development, monitoring and evaluation of effective health policies and programs appropriate to our context, and to our ongoing efforts in NCD risk factor and injuries surveillance.

Because of the multi-factorial nature of NCDs and their determinants, prevention and control strategies need the partnership and engagement of multi-sectoral stakeholders outside the health sector, including relevant government ministries, NGOs, private sector and the community. This report contains actions points for various players that require commitment towards policy development, program implementation, resource mobilization, Monitoring and evaluation.

Finally, this report provides an opportunity to realize the growing burden of NCDs and Injuries whose understanding is a key ingredient towards achieving our national development targets and the Sustainable Development Goal (SDG) 3.4 'By 2030 to reduce by one third premature mortality from non-communicable diseases through prevention and treatment and promote mental health and well-being'.

.....
Dr. Nicholas Muraguri
Principal Secretary
Ministry of Health

Executive Summary

The Kenya STEPS 2015 is the first nationally representative survey to collect comprehensive information on risk factors for NCDs, Injuries and oral health in adults' age 18 - 69 years. The aim of the survey was to establish an NCD surveillance platform that collects baseline indicators on determinants of NCD and their risk factors for policy and planning purposes.

The key objectives of the NCD STEPS survey were:

- a) To determine the prevalence and determinants for the four major behavioral risk factors for NCDs in Kenya: tobacco use, harmful use of alcohol, unhealthy diets, and physical inactivity.
- b) To determine the prevalence and determinants for the four key biological risk factors for NCDs in Kenya: overweight and obesity, raised blood pressure, raised blood glucose and abnormal blood lipids
- c) To determine the prevalence and determinants of unintentional injuries in Kenya.
- d) To determine the prevalence and determinants of oral diseases in Kenya
- e) To investigate potential links between different risk factors and determinants of health (socio-economical status, demographic factors, gender, age)

KENYA STEPS SURVEY 2015 FINDINGS:

Behavioral Risk factors –STEP 1:

Within STEP 1 of the survey, Socio demographic and behavioral information on age, sex, marital status, education, occupation, housing and social amenities were collected. Behavioral Information regarding Tobacco Use, Alcohol Consumption, Diet, Physical Activity, History of Raised Blood Pressure, History of Diabetes, History of Raised Total Cholesterol, History of Cardiovascular Diseases, Lifestyle Advice, History of Diabetes, Cervical Cancer Screening, Injury and Oral health were also collected.

Thirteen percent of Kenyans currently consume some form of tobacco products with a significantly higher prevalence among men (23.0 percent) than women (4.1 percent). The percentage of Kenyans who are currently using smoked tobacco products that includes manufactured cigarettes, hand rolled cigarettes, pipes and shisha is 10.1 percent. Eight percent of Kenyans are daily tobacco smokers with the mean number of manufactured cigarettes smoked per day being seven sticks per smoker. Current use of smokeless tobacco was reported in 3.6 percent of Kenyans. Twenty four percent and 20.9 percent of Kenyans are exposed to second hand smoke at home and work respectively.

Approximately, 19.3 percent of Kenyans currently drink alcohol with 13 percent of these consuming alcohol on a daily basis. However, three in five Kenyans are lifetime abstainers with the percentage of abstinence among women being nearly twice that among men. Heavy episodic drinking defined as drinking six or more drinks on a single occasion was reported by 12.7 percent of Kenyans. The overall mean number of standard drinks per drinking occasion is 9.7 standard drinks with no significant difference between the sexes. Approximately 17 percent of former drinkers had stopped drinking due to health reasons in the past 12 months. Consumption of unrecorded alcohol (alcoholic drink alcohol that is homebrewed alcohol (excluding changaa, busaa or muratina) or any alcohol not intended for drinking was reported by 35.5 percent of adults.

Fruit is consumed on average on 2.5 days a week and vegetables on 5.0 days a week among Kenyans. The World Health Organization (WHO) recommends at least 5 servings of fruits and vegetables a day. The survey results thus show that 94.0 percent of Kenyans are consuming less than 5 servings of fruits and vegetables per day.

Nearly a quarter (23.2 percent) of Kenyans always add salt often before eating or when eating and a further 4.3 percent admitted to always or often consume processed food high in salt.

Twenty eight percent of Kenyans always add sugar to beverages. Majority of Kenyans use vegetable oil (59.1 percent) for cooking, compared to 38.5 percent who use vegetable fat.

Overall, 6.5 percent of Kenyans do not engage in the recommended amount physical activity. WHO recommends that adults aged 18–64 years should do at least 150 minutes of moderate-intensity physical activity throughout the week, or do at least 75 minutes of vigorous-intensity physical activity throughout the week. The median minutes of total physical activity per day is 263. It was established that 68.6 percent of total physical activity is work-related, 26.1 percent transport-related and 5.4 percent recreation-related. 26.1.

More than half (56 percent) of Kenyans have never been measured for raised blood pressure. Among those who reported to have been previously diagnosed with hypertension, only 22.3 percent were currently on medication prescribed by a health worker. Overall, 87.8 percent of Kenyans had never been measured for raised blood sugar and among those diagnosed with elevated blood sugar, less than half (40.1 percent) were currently taking medication. Majority of Kenyans (97.7 percent) have never been measured for cholesterol levels with only 13.3 percent of respondents who reported to have been diagnosed with elevated cholesterol levels being on medication.

Four in ten adult Kenyans have heard of any cervical cancer screening test while only 11.3 percent of women have ever been screened for cervical cancer. Among the age group 30-49 years which is the recommended age for screening, 16.4 percent have ever been screened for cervical cancer.

Only one in five Kenyans have ever been advised to eat at least five servings of fruit and/or vegetables by a health worker while eight percent of the respondents had been advised against tobacco use by a health care worker in the past three years. Ten percent of the respondents have been advised to either stop drinking alcohol or not to start by a health care worker. Ten percent and 11.4 percent have been advised to reduce salt and fat in the diet respectively.

Physical Measurements-STEP 2

Physical measurements such as height, weight and blood pressure were collected in Step 2.

Twenty seven percent of Kenyans are either overweight or obese with the percentage being significantly higher in women (38.5 percent) than men (17.5 percent). Twelve percent of respondents from urban settlements were obese while 7 percent of rural dwellers are obese indicating a big risk of NCDs and their complications.

The mean waist circumference for men and women is 78.6 cm 79.1 cm respectively. Twenty eight percent of the men and 36 % of the Kenyan women had a higher Waist-hip ratio than recommended. The Waist-hip ratio (the waist circumference divided by the hip circumference) is an index used to identify individuals at increased risk of obesity related morbidity due to accumulation of abdominal fat (WHO, 2011). Women whose waist hip ratio (WHR) is ≥ 0.85 and men with a WHR ≥ 0.9 are considered to be at increased risk of obesity-related morbidity.

Raised blood pressure (defined as having SBP ≥ 140 mmHg and/or DBP ≥ 90 mmHg or on medication for raised blood pressure) was found in 23.8 percent of the respondents. Eight percent of the Kenyans have severe hypertension (defined as having SBP ≥ 160 mmHg and/or DBP ≥ 100 mmHg) and among this group seven percent were not currently taking medication.

Biochemical Measurements – STEP 3

The survey results show that 3.1 percent and 1.9 percent of Kenyans have impaired Fasting glycaemia and raised blood glucose respectively. Raised blood glucose was defined as plasma venous value ≥ 7.0 mmol/L or currently on medication for diabetes. Approximately one in ten respondents have cholesterol ≥ 5.0 mmol/L or currently on medication for raised cholesterol. Half of all men (50%) and more than half of the women (60%) had low HDL levels (values of HDL cholesterol below 1.03 mmol/L for men and 1.29 mmol/L for women)

The total risk of developing cardiovascular disease (CVD) was determined by the combined effect of behavioral and biological risk factors (for instance smoking, or having raised blood sugar), age and sex. Eight percent of the Kenyans in the 40-69 age group have a CVD risk of 30 percent or and above with only 6.2 percent of them currently receiving drug therapy and counseling to prevent heart attacks and strokes.

Assessment of the risk posed by combined risk factors was also determined. The five common and critical risk factors for NCDs including current daily smokers, overweight or obese (BMI $> 25 \text{ kg/m}^2$), raised blood pressure (SBP > 140 and/or DBP > 90 mmHg or currently on medication for raised BP), less than 5 servings of fruit and vegetables per day and low level of physical activity were used. Only 3 percent of Kenyans have none of the above risk factors. Among the age group 18-44 years, 10.4 percent have three or more of the above risk factors while among the age group 45 to 69 years, 25.9 percent have three or more of the above risk factors indicate a heightened risk of NCDs and their complications that warrants interventions ranging from awareness, treatment and follow-up.

Violence and Injuries

A vast majority of Kenyans (87.6 percent) do not always use seat belt when travelling in a vehicle. Additionally 94.1 percent of drivers or passengers of motorcycles or motor-scooter do not always use protective helmets. Overall, 3.4 percent of adults reported driving under the effects of alcohol in the past 30 days while 12.7 percent reported to riding in a vehicle with a driver under the effect of alcohol. Six percent of Kenyans have been involved in a road traffic crash during the past 12 of which 53.9 percent

were serious enough to necessitate medical attention. The survey results indicates that 10.4 percent of all respondents got seriously injured in other injuries other than road traffic crashes with the most prevalent injuries being Cuts (47.6 percent) and falls (34.0 percent). Overall, 3.9 percent of the respondents were involved in violent incident resulting in a serious injury in the past 12 months with majority of the injuries being caused by a friend or acquaintance (23.4 percent).

Oral Health

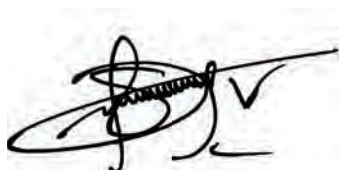

Overall, eighty nine percent of adults have 28 or more natural teeth. Twelve percent and 7.2 percent of Kenyans reported to have poor or very poor state of teeth and poor or very poor state of gums among those having natural teeth respectively. Five percent of Kenyans have removable dentures. While a history of oral pain and discomfort in the past 12 months was reported by 31.6 percent only one in ten Kenyans visited a dentist in the past 12 months. Overall, 62.7 percent of Kenyans have never visited a dentist. Thirty six percent of Kenyans clean their teeth twice daily.

Conclusions and Recommendations

The Kenya STEPs is the first nationally representative survey to collect comprehensive information on risk factors for NCDs, Injuries and oral health in Kenya. It provides essential information on Key NCD indicators by age group, sex and residence, education level and wealth quintile in some cases. The findings are useful in informing public health policy and the following recommendations are proposed:

1. There is a need to Prioritize NCD prevention and control at both national and county level using whole of government, whole of society and life course approach as it is an emerging threat to health, social and economic development.
2. Sustained public awareness campaigns and interventions to reduce the modifiable risk factors for NCDs: unhealthy diets, physical inactivity, harmful use of alcohol, tobacco use and exposure to tobacco smoke.
3. Build the capacity of the health workforce while ensuring the availability, access, affordability and quality of safe, efficacious medicines and basic technologies for screening, diagnosis, treatment and monitoring of common NCDs such as hypertension and diabetes at primary health care.
4. Restructure the health information systems to guarantee reliable, timely, complete and quality data for evidence-based practice and decision making in NCD prevention and control.
5. Establish wellness clinics in all facilities to encourage early detection and screening of NCDs such as diabetes, cervical cancer, hypertension and others as well as serve as sources of information for prevention and health promotion.
6. Strengthen the implementation of the Framework Convention on Tobacco Control (FCTC) by enforcing the provisions of the Tobacco control Act at both the national and county level.
7. Adapt the global strategy to reduce harmful use of alcohol.
8. Strengthen implementation of the Kenya's National Nutrition Action Plan 2012-2017 and ensure continuous engagement with the agricultural sector to promote healthy diets and eating habits.
9. Introduction of legislations on production, packaging and responsible marketing

- of food and drinks to reduce consumption of unhealthy foods.
10. Implement the physical activity tool kit in the country to encourage adoption of active lifestyles and to reduce sedentary lifestyles.
11. Establish mechanisms to foster multi-sectoral collaboration to ensure all the pillars of the decade of action on road safety are well implemented
12. Conduct public education and social marketing campaigns on prevention of injuries.
13. Strengthen the delivery of oral health services throughout the country by raising the awareness on the importance of regular dental checkups and maintenance of proper oral health hygiene.
14. Integrate NCD indicators in national health surveys to supplement the data collected in periodic STEPS survey for proper planning and projection of NCD prevention and control.

.....
 Dr. Jackson Kioko
 Ag. Director of Medical Services
 Ministry of Health

Acknowledgements

The Ministry of Health would like to acknowledge the efforts of the Individuals and organizations that contributed to the success of this Kenya STEPwise Survey. The close cooperation between the Ministry of Health, WHO and the Kenya National Bureau of Statistics (KNBS) was critical to the successful completion of the survey, and special thanks go to the staff of these three institutions.

Further, the technical support from World Health Organization, Kenya Medical Research Institute, African Institute for Health & Development (AIHD), the Kenya diabetes management and information centre (DMI), the African Population and Health Research Center (APHRC) and the Nairobi University in all phases of the survey is appreciated.

Special Thanks go to the office of the Cabinet Secretary for Health, Principal Secretary, Director of Medical Services, the head of the department of preventive and promotive health Dr. Jack Kioko, the head of the Department of Policy, Planning and Health Care Financing Dr. Peter Kimuu and the Director General and the Director, Population & Social Statistics of KNBS. The Division of Non Communicable Diseases wishes to also thank Dr. Custodia Mandlhate the WHO Country Representative and the entire team at the WHO Kenya Country Office for their support.

The contribution and dedication of the following individuals and organizations is highly appreciated; Dr. Kibachio Joseph, Awes Abulkadir, Dr. Gladwel Gathecha, Paul Waweru, Zachary Ndegwa, John Bore, Dr. Jutta Jorgensen, Robert Buluma, Dr. Joyce Nato, Dr. Waihenya Mwangi, Dorcas Kiptui, Scholastica Owondo, Dr. Muthoni Gichu, Prof. Elijah Ogola, Eva Muchemi, Dr. Maina Kiberenge, Lilian Karugu, Dr. Nelson Muriu, Dr. Wekesa Paul, Angela Ngetich, Dr. Ogara Esther, Dr. Alfred Karagu, Prof. Gerald Yonga, Dr. Mary Nyamongo, Winnie Muhoro, Dr. Loise Nyanjau, Peris Wangau, Joshua Muiruri, Dr. George Githuka, Dr. Martin Mwangi, Dr. Duncan Kibongong, Dr. Wences Alvero

We owe the success of this entire survey to the sacrifice of the field team that collected data in the entire country surmounting numerous challenges and setbacks.

We are indebted to the World Bank, WHO, Astrazeneca and the MOH/CDC CoAg for funding the process of development, implementation, printing, launch and dissemination of this report.

CHAPTER ONE

INTRODUCTION

CHAPTER ONE: INTRODUCTION

Kenya Country Profile

Geographical and Governance structure

Geographical structure

Kenya is a former British colony which got independence on 12th December, 1963 and became a republic on December 12, 1964. The country lies between latitudes 4° N and 4° S, and longitudes 34° E and 41° E (Abdelaziz Marhoum & David A. Samper, 2010a). Kenya has a total land area of 224,960 square miles with 5,200 sq. miles comprising of water. The country is positioned on the equator on Africa's east coast and shares borders with five other countries. Kenya's eastern and northern neighbors are Somalia and Ethiopia. To the northwest lies Southern Sudan while Uganda lies to the west and Tanzania to the south. Kenya is divided into seven major geographic regions. (Abdelaziz Marhoum & David A. Samper, 2010)

Coastal Region

The Coastal region extends some 250 miles from the southern border where Kenya meets Tanzania, to the border with Somalia in the north. The coastal region is characterized by a variety of geographical features which include stretches of coral rock and sand interrupted by bays, inlets, and branched creeks. In the inland of the coast is a narrow plain and a low plateau area reaching an elevation of about 500 feet. The main geographic feature of the northern part of the coastal region is the Lamu Archipelago.

Southern Coastal Hinterland

The southern coastal hinterland is a relatively featureless erosional plain with few groups of small hills. The Tana Plains extend northward from the upper coastal region to the northern plains. The plain's eastern edge forms the border of Somalia while the western part of the plain ends with the elevated Eastern Plateau Region. The Tana River flows across the plain from the Kenyan Highlands into the Indian Ocean.

The Eastern Plateau

This region consists of a belt of plains extending north-and southward to the eastern Kenya Highlands. Land elevations vary mainly between 1,000 and 3,000 feet above sea level.

Northern Region

The Northern plain-lands region stretches from the border with Uganda on the west to the Somalia border on the east and consists of a series of arid plains formed by erosion or by great outpourings of lava. The region includes Lake Turkana and the Chalbi Desert. To the West of Lake Turkana are arid lands with scarce rainfall. East of Lake Turkana lies the Chalbi Desert; still farther east are equally arid lands that ordinarily support only semi-desert vegetation.

Highlands Region

The Kenya Highlands Region was referred to as the White Highlands during colonial times. The region consists of two major divisions, lying east and west of the Great Rift Valley. The entire area is characterized by significantly higher altitude, cooler temperatures and more plentiful precipitation than in other regions in the country.

Rift Valley Region

Rift Valley Region comprises of Eastern Africa's Rift Valley which was formed by an extended series of faulting and differential rock movements. The valley stretches from Kenya's Lake Turkana area, running southward through the Kenya Highlands into Tanzania. Near Lake Turkana, the valley floor is less than 1,500 feet above sea level and rises to about 6,200 feet in its central section near Lake Naivasha.

Western Plateau Region

The Western Plateau Region forms part of the extensive basin around Lake Victoria. The region consists mainly of faulted plateaus marked by escarpments that descend gently from the Kenya Highlands to the lakeshore. The region is divided by the Kano Rift Valley into northern and southern sub-regions with distinct geographical features.

Climate.

Kenya's position along the equator makes its terrain highly diversified with climatic conditions ranging from moist to arid. Her seasons are distinguished by duration of rainfall rather than by changes in temperature. In the Western Plateau and the Highlands, rain falls in a single long season while in the east of the Rift Valley, there are two distinct seasons characterized by a period of long rains from March to May and one of short rains from September to October. Rainfall is most plentiful in the Highlands and in the coast. Though much of country has two wet and two dry seasons, total rainfall varies unpredictably. More than 70 percent of the country is arid or semi-arid with sporadic rainfall of less than 51 cm per year. Variations in altitude are the major factor in temperature differences in the various parts of the country. The Highlands generally have cool temperatures. The nation's highest temperatures are found in the Northern Plain. The hottest months fall between January and March while the coldest are June and July.

Vegetation.

Kenya's plant life ranges from mangrove forests and coconut palms on the coast to Savannah grassland and woods to thick coniferous evergreen forests on the mountain slopes. On the western plateaus, low trees grow amid grass over 1.5 meters high. Similar vegetation is found between 915 and 1,829 meters east and south of Mount Kenya and near Tana and Athi rivers. On the northern and southern edges of the highlands, flat-topped trees are scattered through meter-high grass.

Drainage System

The country's principal drainage system begins in the Kenya Highlands Region which forms the source of streams and rivers running eastward toward the Indian Ocean, westward to Lake Victoria, and northward to Lake Turkana. A secondary drainage system is formed by rivers in the southern highlands of Ethiopia, which extends into Kenya along the eastern part of their shared boundary. Most of these rivers are seasonal with some receiving sufficient rainwater. The two largest rivers are the Tana and the Galana, which empty into the Indian Ocean. The Tana basin with an area of about 24,000 square miles receives much of the flow from the Aberdare Range and Mount Kenya. The Galana River has its source in the southeastern Kenya Highlands and flows together with its tributaries into the Indian Ocean north of Malindi. Several other smaller rivers begin in the foothills of the eastern Kenya Highlands in the Tana River basin.

The western Kenya Highlands are drained by a number of rivers that empty into Lake Victoria. The largest of these are the Nzoia, about 160 miles long, and the Yala, with a length of about 110 miles. The Mara River, in the Mau Escarpment in the southwest highlands, flows southward for about 100 miles, enters Tanzania, and turns westward to flow for almost another 100 miles into Lake Victoria. The northern Kenya Highlands east of the Rift Valley are drained by small rivers that disappear in the arid land to the north and by the larger, eastward-flowing system of the Ewaso Ngiro.

Governance Structure

Kenya's central government is structured through the constitution with administrative and policy making powers being distributed to its three arms of government: Executive, Legislature and Judiciary. The current structure is enshrined in the Kenya constitution of 2010. ("Kenya Government," 2015)

The executive is headed by the president of the republic. Appointments of cabinet secretaries and other key positions such as that of the attorney general, secretary to the cabinet, high commissioners, consular representatives and ambassadors are vested in the president subject to approval by parliament.

The Legislature is responsible for advocating for the people's interest in law making. It is vested in two houses: the national assembly and the senate. Members of the national assembly are obligated to represent their constituents and all the special interests within

their respective constituencies while the main roles of the Kenya Senate include debating and approving county bills; determining the allocation of national revenue to be distributed according to the counties; and representing the interests of the counties at the national level.

The judiciary mainly centers on the Kenyan Judicial system which adheres to a hierarchical system, with The Supreme Court being the highest organ, followed by the Court of Appeal, High Court, Magistrate's Courts and other Subordinate Courts. The chief justice is the president of the judiciary and is appointed by the president subject to the approval of the National Assembly.

Devolved Governments

Kenya has 47 county governments, whose main objectives are to involve the people in governance; and allow better supervision and implementation of policies at the grassroots level. The county Government constitutes of a county assembly and county executive. The responsibilities of the county assembly include, exercising the powers of enacting laws at the county level; acting as an oversight instrument on the county executive; and approval of plans and policies for smooth operation and management of resources and county institutions.

The people elect the members of the county assembly at Ward level while additional slots are reserved for nominations. This ensures that membership is well distributed by gender, marginalized groups and persons with disability. The county assembly is headed by a county Speaker who by law is not supposed to be a member of the assembly.

The county executive on the other hand is charged with the responsibility of exercising executive power at the county level; implementing laws for administration of the county as well as carrying out other executive functions of the county. The county executive gives the people an opportunity to be more actively involved in lawmaking. The county executive is led by a governor who is directly elected by the people at the county level. The appointment of the county executive members is placed under the mandate of the governor, and approval is subject to the county assembly.

The Economy

Kenya has a market-based economy that promotes economic efficiency and competition and encourages foreign investment. Since independence, the market structure has changed from one in which prices were influenced by the government to one in which they are determined by the market forces of supply and demand. Liberalization of the agricultural sector was undertaken in the 1980s and 1990s, reducing government's control of agricultural production and marketing. This led to an environment that encouraged private sector participation in agriculture. (Mwangi Kimenyi, 2014)

The Kenyan economy has been fluctuating since independence with the initial years registering high economic growth of up to 6% that declined to below 4% in the following

decades. In the 1990s, Kenya's GDP also experienced great inconsistency, ranging between negative figures to 4%. This economic growth peaked in 2007 at 7% but the post-election violence in early 2008 following a contested election, coupled with the effects of the global financial crisis reduced the GDP growth to 1.7%. The economy has since rebounded in 2010-11 by showing growth rates higher than 5% and the economic prospects for Kenya for the coming years remain favorable. ("Kenya Economy," 2015)

According to 2015 Economic Survey, Kenya's economy expanded by 5.3 per cent in 2014, compared to a growth of 5.7 per cent in 2013. A number of factors influenced the country's economic performance during the review period. From the demand side, government and private final consumption increased by 2.7 per cent and 5.5 per cent, respectively. The major drivers of the economy were agriculture, forestry and fishing(14.5 percent), construction(11.1 percent); wholesale and retail trade (9.8 percent); education(9.7 percent); and finance and insurance (9.1 percent).

The World Bank, in its Kenya Economic Update for March 2015, projected the economy to grow by 6% in 2015. The growth is expected to be supported by lower energy costs, investment in infrastructure, agriculture, manufacturing and other industries. A stable macroeconomic environment, continued investment in infrastructure, improved business environment, exports and regional integration will help sustain the growth momentum. ("Kenya Overview," 2015)

Despite Kenya having very limited arable land and rainfall, it has a vibrant agricultural sector with horticulture contributing the highest percentage of agricultural gross domestic product (33 percent), followed by food crops (32 percent). Equally, Kenya is doing tremendously well in mobile money services sector which has given the economy a big boost. Tourism is another main industry in Kenya exploiting the great flora and fauna of the country coupled by a warm spirit of the people.

Kenya is the consistently growing its export portfolio with its main export partners being the other East African states as well as the UK, the Netherlands and the US. Main import partners include China, India, United Arab Emirates (UAE) and South Africa.

Kenya does not have a well established oil industry, but recent discoveries of oil in the Northern part of the country may change that. It is the first time that Kenya has made such a discovery, but the commercial viability of the findings has still not been confirmed .

The Population

According to the Kenya Population and Housing Census 2009, Kenya has a population of 38,610,097 comprising of 19,192,458 males and 19,417,639 females. Approximately 43 percent of the population is below 15 years of age while 4 percent is above 65 years of age. The Kenya's population is projected to be 44,156,577 in 2015 with 41 percent being below 15 years of age and 3 percent above 65 years of age.

Social Services, Health Policy, and Health Status

Social Services

Social Health determinants include maternal education, nutrition, safe water, adequate sanitation, and proper housing among others. Maternal education has a strong correlation with a child's health and survival. In Kenya, there have been improvements in maternal education over the years, with declines in the numbers of women with no education and increases in those with secondary or higher education.

Even though there has been improvements in acute nutrition deficiencies, such as underweight in children under five, not much improvement has been seen in the prevalence of more chronic under-nutrition variables, such as stunting and wasting the nutrition status of women has also shown stagnating patterns.

There has been an improvement in the availability of safe water sources and sanitation facilities particularly in rural areas, although some regions such as arid and semi-arid areas still have poor services. Housing conditions have been improving, with a notable increase in households using permanent roofing, and a decrease in households using earth floors. The proportion of population in active employment has been reducing with an associated increase in the proportion of inactive population. Migration from rural to urban areas is mostly noted among people aged 20 – 34 years significantly contributing to an increase in the urban population which in turn has fuelled an increase in the urban informal settlements and their associated health risks.

Health Policy

The Kenya Health Policy, 2014–2030 gives directions to ensure significant improvement in overall status of health in Kenya in line with the Constitution of Kenya 2010, the country's long-term development agenda, Vision 2030 and global commitments. It demonstrates the health sector's commitment, under the government's stewardship, to ensuring that the country attains the highest possible standards of health, in a manner responsive to the needs of the population.

This policy is designed to be comprehensive and focuses on the two key obligations of health: realisation of fundamental human rights including the right to health as enshrined in the Constitution of Kenya 2010 and; contribution to economic development as envisioned in Vision 2030; and. It focuses on ensuring equity, people centeredness, participatory approaches, efficiency, multi-sectoral approach, and social accountability in the delivery of healthcare services. The policy embraces the principles of protection of the right to health and fundamental freedoms of vulnerable groups of persons, including children, persons with disabilities, youth, minorities, the marginalised and older members of the society, in accordance with the Constitution.

The policy takes into account the functional responsibilities between the two levels of government (county and national) with their respective accountability, reporting, and

management lines. It proposes a comprehensive and innovative approach to harness and synergise health services delivery at all levels and engaging all actors, signalling a radical departure from past approaches in addressing the health agenda. There is therefore, need to raise awareness and ensure that the objectives of this policy are understood and fully owned by the various stakeholders and implementing partners.

The policy has six objectives that span across the whole spectrum of health determinants ranging from infectious, non-communicable diseases and injuries.

Health Status

The life expectancy at birth in Kenya is 61.5 years comprising 59.9 years for men, 63.1 years for women. Based on the 2014 Kenya Demographic and Health Survey, the total fertility rate (TFR) for women aged 15-49 years is 3.9 births per woman. In the same period, 58 percent of women in the reproductive age group were using modern contraceptive methods. The crude birth rate was 30.5 per 1000 population in 2014, and the crude death rate was 8.3 per 1000 population in 2013. The infant mortality rate is estimated at 39 per 1000 live births, and child mortality is 14 per 1000 live births while as the under-five mortality rate at 52 per 1000 live births,

Slightly more than half of currently married women (58 percent) are currently using some method of contraception; while 65 percent of sexually active unmarried women currently use some method of contraception. About 62 percent of births in Kenya are delivered by a skilled provider. A similar proportion of deliveries (61 percent) take place in health facilities. Overall, 68 percent of children age 12-23 months are fully vaccinated with BCG, measles, pentavalent, polio, and pneumococcal vaccines; 71 percent have received all basic vaccinations.

Health Sector Financial Allocations and Expenditure

The government expenditure on health as a percentage of total government expenditures has remained between 6 and 8 per cent over the last decade. Within the last two years, health expenditures as a proportion of GDP increased from 5.1% to 5.4 % while public expenditures as a proportion of general government expenditures has been reduced from 8.0% to 4.6% during the same period. The health sector is predominantly financed by private sector sources (including by households' out-of-pocket (OOP) spending.

Non-communicable Diseases

The Burden of NCDs

Non-communicable diseases (NCDs) are the leading causes of morbidity and mortality globally, causing more deaths than all other causes combined. Non communicable diseases (NCDs) kill 38 million people each year accounting for 63% of deaths globally, with 80% of these deaths occurring in developing countries whose fragile health systems are still grappling with a heavy burden of communicable diseases resulting to a duo burden of disease.

The World Health Organization (WHO) estimates that NCDs will cause 73% of global deaths and 60% of the burden of disease by 2020. Sixteen million of NCD deaths occur before the age of 70 with 82% of these "premature" deaths occurred in low- and middle-income countries. Cardiovascular diseases account for most NCD deaths, or 17.5 million people annually, followed by cancers (8.2 million), respiratory diseases (4 million), and diabetes (1.5 million). These 4 groups of diseases account for 82% of all NCD deaths with tobacco use, physical inactivity, the harmful use of alcohol and unhealthy diets all increase the risk of dying from an NCD significantly.

Besides the burden of deaths and disability, non communicable diseases pose a greater social and economic burden to the economy. NCDs threaten progress in the post-2015 development agenda as poverty is closely linked with NCDs. The rapid rise in NCDs is predicted to impede poverty reduction initiatives in low-income countries, particularly by increasing household costs associated with health care. Vulnerable and socially disadvantaged people get sicker and die sooner than people of higher social positions, especially because they are at greater risk of being exposed to harmful products, such as tobacco or unhealthy food, and have limited access to health services.

In low-resource settings, health-care costs for cardiovascular diseases, cancers, diabetes or chronic lung diseases can quickly drain household resources, driving families into poverty. The exorbitant costs of NCDs, including often lengthy and expensive treatment and loss of breadwinners, are forcing millions of people into poverty annually, stifling development.

Up to 80% of premature deaths from heart disease, stroke and diabetes can be averted with evidence based behavioral and pharmaceutical interventions.

1.2.3 NCDs in Kenya

Non communicable diseases accounts for more than 50% of total hospital admissions and over 55% of hospital deaths in Kenya. The major NCDs are cardiovascular conditions, cancers, diabetes, and chronic obstructive pulmonary diseases with their sequelae and their shared risk factors. Equally contributing to the huge burden are violence and injuries, haemoglobinopathies, mental disorders, oral, eye and dental diseases

Cancer

In Kenya, it is estimated to be the second leading cause of NCD related deaths after cardiovascular diseases and accounting for 7% of overall national mortality. (World Health Organization (WHO), 2014)

Existing evidence shows that the annual incidence of cancer is close to 37,000 new cases with an annual mortality of over 28,000 making cancer the third leading cause of death after infectious diseases and cardiovascular conditions. These estimates are conservative and could be higher given that many cases go unreported and unaccounted for. The leading cancers in Kenyan women are breast, cervical and esophagus. Breast cancer affects 34 per 100,000 population while cervical cancer affects 25 per 100,000 population a clear

indication of the threat cancer poses to women. In men, esophageal, prostate cancer and Kaposi sarcoma are the most common cancers with incidence rates of 17.5, 15.2 and 9.2 per 100,000 men respectively. (C. I. Report, 2002)

Risk factors for cancer in Kenya includes genetic predisposition, behavioral risk factors (mainly smoking, alcohol use, inadequate physical inactivity and poor diet), environmental carcinogens (e.g. aflatoxin and asbestos), and infections (e.g. HPV in cervical cancers, Hepatitis B and C in liver cancers, H. Pylori in stomach cancers, HIV in Kaposi Sarcoma). While early detection ensures a favorable outcome and prognosis of most cancers, about 80% of reported cases are detected at an advanced stage when very little can be achieved in terms of treatment. Some of the challenges include low awareness of cancer signs and symptoms, inadequate early detection services, weak referral systems, poor treatment and palliative services. Achieving universal coverage for the key cancer control interventions will therefore be vital in halting and reducing the rising burden of cancer in Kenya. Key interventions for cancer prevention and control prioritized in Kenya include primary prevention, early detection, effective diagnosis and treatment, pain relief and palliative care, cancer surveillance and research, monitoring and evaluation and proper coordination of cancer control and prevention activities.

Diabetes

This rise in diabetes is associated with demographic and social changes such as globalization, urbanization, aging population and adoption of unhealthy lifestyles such as consumption of unhealthy diets and physical inactivity. In Kenya, the prevalence of diabetes in adults is estimated to be 4.56% according to IDF, amounting to almost 750,000 persons and 20,000 annual deaths. There is a disparity in distribution with an estimate of approximately 10.7% among urban and 2.7% among rural dwellers (Diabetes Atlas 2014) this figure is based on regional projections and is likely to be an underestimation as over 60% of people diagnosed to have diabetes in Kenya usually present to the health care facility with seemingly unrelated complaints. It is also estimated that about 14% of the population in Kenya have impaired glucose.

As the prevalence of Diabetes mellitus is escalating, patients face an even greater threat from long term complications like foot, cardiovascular, eye, nerve and renal complications that are the hall mark of diabetes and its impact. Owing to poor glycemic control, a majority of patients referred for specialized end organ damage treatment at the national referral hospitals and outside the country are diabetes patients. More than 200 risk factors for CVD has to date been identified (Reid, 2001) with the major modifiable risk factors being high blood pressure, abnormal lipids levels, tobacco and alcohol use, physical inactivity, obesity, unhealthy diets

Cardiovascular Diseases

Mortality due to CVD in Kenya ranges from 6.1% (NHSSP) to 8% (World Health Organisation, 2014), while autopsy studies suggest that more than 13% of cause-specific deaths among adults could be due to CVDs (Bloomfield et al, 2014)(Ogeng'o, Gatonga, & Olabu, 2011). The prevalence of hypertension has increased over the last 20 years. Recent studies have shown the overall prevalence to vary in various Kenyan communities. A study in Korogocho slums in Nairobi indicated the overall prevalence of hypertension in adults of 18% (Oti et al., 2013) while in Garrissa County, the level is lower at 12.6 (Hasan, 2012). Other studies have showed levels of HTN among adults at 21.4% in rural Kenya (Hendriks et al, 2012) and 50% in population over 50 years in Nakuru (Mathenge, Foster, & Kuper, 2010). RHD continues to be a major contributor to cardiovascular disease prevalence and affects both in children and adults

Chronic Obstructive Pulmonary Disease (COPD)

Chronic Obstructive Pulmonary Disease (COPD) describes chronic lung diseases that cause limitations in lung airflow. COPD is an often under-diagnosed, life threatening lung disease that may progressively lead to death.

Despite high prevalence in developed nations, almost 90% of COPD deaths occur in low- and middle-income countries (WHO Fact sheet N315)

The main drivers of COPD include tobacco smoking, indoor air pollution (from use of biomass fuel for cooking and heating), outdoor air pollution and occupational dusts and chemicals. Within sub-Saharan Africa, limited data on COPD exists but the BOLD study reported COPD in 22.2% of men and 16.7% of women aged above 40 years. In Kenya COPD is estimated to cause approximately the same amount of DALYs as ischemic heart disease, stroke and epilepsy (GBD 2010 Heat Map

Injuries and Violence

In Kenya, injuries are becoming an increasingly important cause of hospital admissions and mortality. The leading causes of injury in Kenya include assault (42%), road traffic crashes (RTC) (28%), unspecified soft tissue injury (STI) (11%), cut-wounds and dog-bites, falls, burns and poisoning (each <10%).

Road traffic crashes are the ninth leading cause of mortality in Kenya. In 2015 data from the National Transport and Safety Authority indicates that road traffic crashes were responsible for 3057 deaths. Pedestrians are the most commonly affected in road traffic incidences where they comprise 43% of road traffic fatalities in 2015. Violence is ranked as the ninth highest cause of mortality in Kenya (Health, 2015). According to violence against children national survey conducted in 2010, 48.7% of female and 47.6% of male aged between 13-17 years had experienced some form of physical violence in the preceding 12 months before the survey.

The Kenya Health and Demographic Survey 2008/9 revealed that 39% and 20.6% of women have ever experienced physical and sexual violence respectively.

Mental disorders

Mental disorders are an important cause of morbidity and contribute to the global burden of non-communicable diseases. Their control requires therefore equitable access to effective programmes and health care services.

Mental disorders also affect, and are affected by other non-communicable diseases: they can be a precursor or consequence of a non-communicable disease, or the result of interactive effects. For example, there is evidence to suggest that depression predisposes people to heart attacks and, conversely, heart attacks increase the likelihood of depression. The same appears for diabetes, where the association of depression to diabetes appears stronger than the inverse (Lyketsos, 2010).

Depression is associated with severe obesity, physical inactivity, and poor self-care, all risk factors for diabetes, and studies suggest long-term use of antidepressants increases the risk of diabetes by almost twofold (Raval, Dhanaraj, Bhansali, Grover, & Tiwari, 2010). Despite these strong connections, mental disorders in patients with non-communicable diseases as well as non-communicable diseases in patients with mental disorders have not received the attention they deserve. Mental disorders share common risk factors with other non-communicable diseases such as sedentary behavior and harmful use of alcohol and are more common among the economically underprivileged population segments such as those with lower educational level. UMM

Non communicable diseases prevention and control

The National NCD strategic plan 2015-2020 was launched in July 2015 by the Ministry of Health as the strategic blue print for the national and county response to non-communicable diseases prevention and control for the next five years in Kenya. It has the following strategic priorities. This strategy aimed to establish mechanisms to raise the priority accorded to NCDs at national and county levels and to integrate their prevention and control into policies across all government sectors. It also was meant to coordinate, formulate and strengthen legislations, policies and plans for the prevention and control of non-communicable diseases at both county and national government levels.

In a bid to strengthen primary prevention, the strategic plan was to promote healthy lifestyles and implement interventions to reduce the modifiable risk factor for NCDs: unhealthy diets, physical inactivity, and harmful use of alcohol, tobacco use and exposure to tobacco smoke while putting in place interventions to reduce exposure to environmental, occupational and biological risk factors.

To Promote and strengthen advocacy, communication and social mobilization for NCD prevention and control and to Promote sustainable local and international partnerships for the prevention and control of non-communicable diseases by Strengthening health systems for NCD prevention and control across all levels of the health sector was also an objective of the strategy.

Considering the rising burden of violence and injuries, the government aims to promote and implement evidence based strategies and interventions for prevention and control of violence and injuries and to Establish and strengthen effective Monitoring & Evaluation (M&E) systems for NCDs and their determinants.

Finally, the National NCD strategic plan 2015-2020 aimed to promote and conduct research and surveillance for the prevention and control of non-communicable diseases. This was the basis of conducting the Kenya stepwise survey for non communicable diseases risk factors 2015.

CHAPTER TWO

SURVEY METHODS AND OPERATIONS

CHAPTER TWO: SURVEY METHODS AND OPERATIONS

2.1 Survey Rationale and Objectives

Kenya is experiencing an epidemiological transition in its diseases burden from infectious to non-communicable conditions resulting in a double burden of disease. Non communicable diseases are a major public health concern with significant social and economic implications in terms of health care-needs, lost productivity and premature death. NCDs are thus a serious setback to our attainment of social, health and economic targets if no proper interventions are put in place.

The disease burden caused by NCDs in Kenya is fueled by adoption of unhealthy lifestyles whose magnitude and impact on NCDs has not been documented hitherto appropriately. Planning and programming has been depended on fragmented local data and epidemiological models and projections that may not be nationally representative or accurate.

A comprehensive study was therefore needed to examine the prevalence and the magnitude of common risk factors for NCDs in Kenya which is useful to the Ministry of Health and county governments to establish interventions that are based on local risk factor burden.

The basis of chronic disease prevention is the identification of the major common risk factors and their prevention and control as the risk factors of today are the diseases of tomorrow. Additionally, information from this study will provide baseline data that will be used to assess disease trends and impact of various interventions. This will be the first national NCD risk factor survey against which future surveys can be based to assess impact and effectiveness of national prevention and control efforts for NCDs and their risk factors.

The general objective of the survey was to establish the magnitude of the major behavioral and biological risk factors for Non-Communicable Diseases in Kenya. Additionally, it was meant to determine the magnitude of unintentional injuries and oral diseases in Kenya which have an equally high burden.

The specific objectives were:

- a) To determine the prevalence and determinants for the four major behavioral risk factors for NCDs in Kenya: tobacco use, harmful use of alcohol, unhealthy diets, and physical inactivity.
- b) To determine the prevalence and determinants for the four key biological risk factors for NCDs in Kenya: overweight and obesity, raised blood pressure, raised blood glucose and abnormal blood lipids
- c) To determine the prevalence and determinants of unintentional injuries in Kenya.
- d) To determine the prevalence and determinants of oral diseases in Kenya
- e) To investigate potential links between different risk factors and determinants of health (socio-economical status, demographic factors, gender, age)

2.2 Survey Sampling and Methodology

2.2.1 Sample Size and Eligibility

The 2015 Kenya STEPs survey was a national cross-sectional household survey designed to provide estimates for indicators on risk factors for non-communicable diseases for persons age 18 – 69 years. The sample was designed with a sample size of 6,000 individuals to allow national estimates by sex (male and female) and residence (urban and rural areas).

The survey used the fifth National Sample Surveys and Evaluation Programme (NASSEP V) master sample frame that was developed and maintained by KNBS. The frame was developed using the Enumeration Areas (EAs) generated from the 2009 Kenya Population and Housing Census to form 5,360 clusters split into four equal sub-samples.

A three-stage cluster sample design was adopted for the survey involving selection of clusters, households and eligible individuals. In the first stage, 200 clusters (100 urban and 100 rural) were selected from one sub-sample of NASSEP V frame. A uniform sample of 30 households from the listed households in each cluster was selected in the second stage of sampling. The last stage of sampling was done using Personal Digital Assistants (PDAs) at the time of survey, where one individual was randomly selected from all eligible listed household members using a programmed KISH method of sampling. Details of the sample design are provided in Appendix A.

2.2.2 Survey Tools and Structure

The tools and structure for the survey was adapted from the WHO STEPwise approach to chronic disease risk factor surveillance (STEPS) with modification to suite the Kenyan situation. The approach was a sequential process consisting of three 'steps' of information gathering as follows:

Step 1 Interviews on demographic information and selected major health risk behaviors

Step 2 Anthropometric measurements on Blood Pressure and heart rate, height, weight, waist and hip circumference.

Step 3 Biochemical measurements of fasting blood glucose, triglyceride, and cholesterol levels.

Figure 1.1: The WHO STEPwise approach to surveillance of NCDs

The questionnaire used covered all core modules and expanded questions relevant to Kenya. The following are the contents of the questionnaire.

STEP 1 included gathering information on demographic and behaviour.

- **Demographic Information:** questions regarding the demographic information of individual, i.e., age, sex, marital status, education, and occupation. In addition, questions on housing and social amenities were included in the module.
- **Behavioral Information:** questions on Tobacco Use, Alcohol Consumption, Diet, Physical Activity, History of Raised Blood Pressure, History of Diabetes, History of Raised Total Cholesterol, History of Cardiovascular Diseases, Lifestyle Advice, History of Diabetes, Cervical Cancer Screening, Injury and Oral health.

STEP 2 included **Physical Measurements** on Blood Pressure, Heart Rate, Height, Weight, and Waist & Hip Circumference.

- The height measurements were taken in centimeter by using a portable height measuring equipment using unique ultrasonic and infrared technology.
- Weight measurement was done in kilogram using a portable electronic weighting scale.
- Waist circumference measurements were done using a constant tension tape across the umbilicus level.
- Blood pressure and pulse rate was taken three times using an automated blood pressure measuring instrument (OMRON®).

STEP 3 included **Biochemical Measurements** on Blood Glucose and Blood Lipids.

- A point-of-care instrument (CardiocheckPA analyzer®) from PTS diagnostics was used for Blood Glucose and Blood Lipids.

The full questionnaire is attached in Appendix C

Data collection was administered using a Personal Digital Assistant (PDA) loaded with eSTEPS software. The system was designed to allow PDA to show only a question and all its possible answers at a time in one screen view, and also provided various filters, skips and validation procedures.

2.2. 3 Ethical Consideration

Informed Consent.

Written Informed consent was sought from the selected individual

Confidentiality

Strict confidentiality was be maintained and all personal identifiers were be delinked by coding. Personal identifies only appeared in the consent form which were stored separately. The codes were stored securely in a password protected computer .All data collected were kept secured, in locked storage spaces for the written notes or in password-protected files and computers for the digital files. All team staff were trained in ethical procedures and measures to protect confidentiality and were required to sign confidentiality agree-

ments.

Protection of Human Participants

The main benefit for participants in this survey was their contribution to informing, identifying, and improving NCD prevention, care, and treatment interventions. Participants did not directly benefit from their participation but indirectly benefit from the improvement of NCD prevention, care, and treatment services within their communities. Another benefit was the possibility of identification and referral for treatment of non-communicable diseases after presentation of the results. Participants were referred to the nearest health facility or facility of their choice using a referral form.

Specimen taking was done using appropriate infection control procedures protecting both the participant and study staff. The risk of participation for all the respondents was minimal, being limited mostly to temporary discomfort associated with the finger prick blood collection process.

Survey Administration

Training of Data Collectors

A six-day training workshop was held where the training programme included sessions on STEPS survey background, sampling methods, cluster-level sampling of households, questioning skills including obtaining informed consent, how to use PDAs, questionnaire completion, blood taking, testing and referral procedures. Orientation of supervisors on supervision skills and checking (editing) of completed questionnaires were also conducted.

After the training, twenty teams were constituted who included a Supervisor, two Research Assistants, and two Health Workers (a clinician and a laboratory technologist) per team. Three teams that had a high work load had two additional members. The training for the STEPS survey was conducted in a centralized location and the trainees included 20 supervisors, 45 interviewers and 43 health workers. The training was designed to follow the standard approach in training and included class presentations, use of IPAQ PDAs and mock paired interviews. In addition, all the trainees participated in a full day practice fieldwork in a few selected areas surrounding the training venue. The various approaches to training were aimed at helping participants understand the survey concepts and how to complete the questionnaires using IPAQ PDAs. Participants were also given tips on interviewing techniques and field procedures. All the supervisors were taken through a special session on logistics, quality control, data management and transmission.

Fieldwork

Fieldwork started after completion of data collection training and it took place over a period of 60 days from 9th April 2015 to 10th June 2015. Fieldwork was conducted by the trained 20 teams each composed of one supervisor and two interviewers and two lab technicians. In addition, a team of six technical coordinators and regional coordinators were in charge of the teams to ensure that quality data was collected.

STEPS is a sequential process that starts with gathering key information on NCD risks

factors with a questionnaire, then moves to simple physical measurements and then to more complex collection of blood samples for biochemical analysis.

Specifically, the STEPS approach was conducted through the three levels of data collection:

- Step 1:** Contained the core or “minimum set” of self-report measures. This includes socio-economic data, data on tobacco and alcohol use, and some measure of nutritional status and physical inactivity, as markers of current and future health status. This information was collected using Personal Digital Assistant (PDA) loaded with eSTEPS questionnaire.
- Step 2:** Included simple physical measurements, such as height, weight, waist circumference, and blood pressure. This was done after consent by the health worker assisted by the interviewer.
- Step 3:** This step happened on day two after fasting instructions were given on day one. This step involved collecting and analyzing blood samples to assess fasting blood glucose and blood lipid levels. The results were captured immediately and released to the participant.

2.3.2.1 Electronic Data Collection

The field data collection for 2015 STEPS survey was fully undertaken electronically using the IPAQ PDAs. Each interviewer was supplied with an IPAQ together with its accessories and an extra battery. The PDAs were programmed to automatically save the data in both internal memory and also in the provided Secure Digital Card (SD card).

The STEPS survey data was backed up every day by the supervisors who had laptops to retrieve the data from SD cards and later emailed the zipped folders to a provided central address every two days. The electronic data collection was successful and there was no data loss. However, one PDA malfunctioned in the course of data collection and interviews had to be repeated for the affected households

Each STEPS survey team was composed of a supervisor, two enumerators who conducted step one, two health care workers (a clinician or a laboratory personnel) who performed step two and three. The team visited households and conducted face to face interviews by administering the questionnaires. The interview would start with an explanation of the study and thereafter written consent obtained. After the interview, anthropometric measurements and blood pressure were measured. Fasting instructions would be given and biochemical measurements taken the following day in the household.

There was a total of twenty teams, who on average did 8 interviews per day. Five days were allocated per EA to include call-backs, transfer to new EA, and resting time for data collectors. The survey time period was 60 days which was enough to complete the data collection exercise.

2.3.2.2 Data Quality Management

Since the supervisors had been instructed to send their team’s data every two days, incoming data were checked for consistency by a central control team at KNBS. Any identified problems were communicated back to the teams for rectification.

The following were the quality assurance measures put in place to ensure the quality of field data collection:-

- a) All field personnel were-trained rigorously on interview techniques and use of the equipment.
- b) The questionnaire was translated into Kiswahili and back to English.
- c) Each team of field workers was supervised by a team supervisor.
- d) The Supervisors spot checked at least 5% randomly selected households and conducted interviews for each of the fieldworkers they supervised. They also conducted sit-ins and observations for each field interviewer at the initial stages of data collection at random intervals.
- e) Team leaders checked all questionnaires filled by interviewers to check for potential errors and missing information. Where it was necessary, the field worker was asked to revisit the respondent and clarify the information.
- f) The study co-coordinators conducted random spot checks across the study areas.
- g) All interview responses were recorded electronically using PDAs. Hence, there was no need for manual data entry.
- h) The eSTEPS questionnaire was pre-coded with specific check codes and skip patterns to minimize entry errors.
- i) Biochemical results were recorded on a paper and entered into the database twice.
- j) For the chemical biomarkers, control strips were used at recommended intervals to ensure that equipment were taking accurate measurements.
- k) The final dataset was cleaned by a team of qualified data analysts.

2.3.2.3 Logistical Challenges/Limitations

Considering the unique nature of the STEPS survey, the following were some of the logistical challenges encountered during the survey:-

- a) Financial constrains that necessitated multi-stakeholder engagement for fundraising. Owing to different financial processes of the different stakeholders, some aspects of the survey were delayed.
- b) This was a large survey with numerous call backs and having to come back to every house hold for the step 3 that meant a coordination and logistical challenge.
- c) The heavy rains and floods that were being experienced at the time caused delays owing to change of routes due to floods, migration of populations and inaccessibility of some areas.
- d) There were serious security concerns as the survey happened around the same time as a terrorist attack in one of the areas that meant an increase in the budget owing to security costs and increase in days in areas where night travel was not permitted.
- e) Some study staff were derailed by sickness and 2 pregnant ladies delivered during the survey. This was however handled by prompt deployment of trained reserve interviewers.
- f) Some equipment malfunctioned causing delays as teams waited for replacements or repair.

2.4 Data Management

2.4.1 Weighting of Data

To produce unbiased estimates, sampling weights were calculated as the inverse or reciprocal of all the selection probabilities at all the stages mentioned above. The weights were derived from the processes involved in the creation of sampling frame (NASSEP V) and selection of individuals in the study. Further, the weights were adjusted to cover individual non-responses. Post stratification adjustments were done to align with the population projections according to age-sex categories. All the results presented in the report, except for the response rates and demographic outputs, are based on weighted data.

2.4.2 Data Analysis

The data analysis team, in conjunction with the report writing team developed the tabulation plans for the key indicators used in this report. Data cleaning for STEPS survey data was done in Microsoft Excel and Statistical Package for Social Sciences (SPSS). The data was then exported to Microsoft Access which is the platform that Epi Info Software uses to generate the standard WHO STEPS tabulations. The outputs were then copied from html files that are generated by Epi Info software to Microsoft word processor.

2.4.3 Analysis and Report writing

A team of NCD experts from the Ministry of Health, WHO and KNBS staff were involved in putting the findings of the survey in perspective, generating recommendations from the findings and in compiling the Kenya STEPS survey 2015 report.

CHAPTER THREE

SURVEY RESULTS

CHAPTER THREE: SURVEY

3.1 Response rate

A total of 6,000 households were sampled, of which 4,754 gave consent for the next stages of the survey. This represents an overall response rate of 92 percent for households that were found occupied at the time of the fieldwork (after excluding dwellings that were vacant or had been destroyed).

Of all the households that gave consent, a total of 4,500 eligible individuals were successfully interviewed for STEP 1, yielding a response rate of 95 percent. The response was slightly higher in rural areas (95.1%) than in urban areas (94.2%). Actual refusals accounted to only 2 percent of all eligible respondents.

The STEP 2 (Physical Measurements) that were done immediately after the individual interviews recorded a 99 percent response for both urban and rural areas. However, the STEP 3 (Biochemical Measurements) that were done a day later recorded a slightly lower response rate of 93 percent

3.2 Characteristics of the Survey Respondents

Age and Sex distribution of Respondents

Table 3.2.1 shows the distribution of respondents age 18-69 by age group and sex. Women and men constitute 40 and 60 percent of the respondents respectively. The largest age group is 30-44 years at 38 percent.

Table 3.2.1: Age group and sex of respondents

Age Group (Years)	Men		Women		Both Sexes	
	n	%	n	%	n	%
18-29	561	37.4	937	62.6	1498	33.3
30-44	725	42.3	989	57.7	1713	38.1
45-59	355	40.6	520	59.4	875	19.4
60-69	159	38.4	255	61.6	414	9.2
TOTAL	1799	40.0	2701	60.0	4500	100.0

Highest Level of Education

Table 3.2.2 indicates the distribution of the respondents age 18 - 69 by the level of education, age group and sex. Approximately 13 percent of the respondents have no formal schooling. The results show that 18 percent of the women have no formal schooling compared with 7 percent of men. Majority of the respondents (33 percent) have completed primary school.

Table 3.2.2: Highest level of education

Age Range	n	No formal Schooling	95% CI	Primary school incomplete	95% CI	Primary school complete	95% CI	Secondary school and above	95% CI
Men									
18-29	561	2.6	0.8-4.4	20.3	15.4-25.2	32.8	27.7-37.9	44.4	36.5-52.3

Household wealth index quintiles

Wealth in 2015 STEPS Survey is used to determine the relative economic status of the households surveyed. In order to measure it, a proxy index was created based on the survey responses from several household variables.

These variables fall in the following categories:

- a) Type of dwelling
- b) Ownership of the dwelling
- c) Construction materials of the dwelling
- d) Source of cooking fuel
- e) Source of lighting fuel
- f) Household possessions/goods
- g) Source of water for household consumption
- h) Type of sanitation facility

The wealth index was then generated using the multivariate statistical technique (Principal Components Analysis). Principal components are weighted averages of the variables used to construct them. Among all weighted averages, the first principal component is usually the one that has the greatest ability to predict the individual variables that make it up, where prediction is measured by the variance of the index. The wealth index was therefore the first principal component of the indicated variables.

The generated index was then used to categorize the households into five quintiles:

1. Poorest
2. Second
3. Middle
4. Fourth
5. Richest

The table 3.2.4 shows the distribution of respondents by wealth quintile. The age group 18-29 has the highest percentage of responds in the richest quintile at 26 percent.

Table 3.2.4: Wealth quintiles by Age group of respondents

Age Group	n	% Poorest	% Second	% Middle	% Fourth	% Richest
18-29	1498	17.7	17.0	15.1	23.9	26.3
30-44	1713	20.0	20.4	21.0	17.9	20.8
45-59	875	21.4	22.4	23.9	18.9	13.5
60-69	414	25.8	23.9	25.6	17.1	7.5
TOTAL	4500	20.0	20.0	20.0	20.0	20.0

3.3 Behavioral Risk factors

3.3.1 Tobacco Use

Tobacco use is a major public health problem worldwide and it is the single most preventable cause of morbidity and mortality (W. H. O. Report, The, & Epidemic, 2008). Tobacco use continues to kill nearly 6 million people each year, including more than 600 000 non-smokers who die from exposure to tobacco smoke. Nearly 80% of these deaths occur in low and middle-income countries that are still grappling with communicable diseases. The prevalence of Tobacco use in the World Health Organization (WHO) Afro region is estimated at 14% .(Network of African Science Academies, 2014)

Kenya ratified the Framework Convention on Tobacco Control in 2004 followed by enactment of a comprehensive Tobacco Control Act (TCA) in 2007. One of the key focus areas of the TCA is research for policy formulation.

This section describes tobacco use status of respondents age 18 to 69 in Kenya. Tobacco products include smoked products (cigarettes, hand-rolled, cigars, waterpipes/shisha, or pipes/kiko) and smokeless tobacco products (snuff, chewing tobacco, kuber and pan).

Current tobacco users

Table 3.3.1 shows the distribution of current tobacco use by age group and sex. Current tobacco use is defined as use of any tobacco product within the past 30 days. The overall prevalence of current tobacco use is 13 percent with significantly higher prevalence among men (23 percent) than women (4 percent). The age group 60-69 had the highest percentage of tobacco use (22 percent)

Table 3.3.1

Age Group (years)	Men			Women			Both Sexes		
	n	% Current users	95% CI	n	% Current users	95% CI	n	% Current users	95% CI
18-29	560	17.0	11.5-22.6	936	2.8	0.2-5.3	1496	9.6	6.5-12.6
30-44	722	26.4	21.8-30.9	989	3.3	1.0-5.6	1711	14.9	12.0-17.7

A third of the daily cigarette smokers consume less than five cigarettes per day while five percent smoke more than twenty five cigarettes daily (Appendix Table B1)

Smoking status

Table 3.3.5 shows the smoking status of respondents categorized as daily smokers, non daily smokers, former smokers and never smokers. Overall, 8 percent of the respondents are current daily smokers. Eighty three percent of respondents have never smoked while 7 percent are former smokers. Ninety seven percent of the women have never smoked compared with 67 percent of the men

Smokeless Tobacco

Table 3.3.8 shows the distribution of current smokeless tobacco users by age group and sex. Overall, 4 percent of the respondents currently use smokeless tobacco. The age group 60-69 are the highest users of smokeless tobacco (9 percent). The percentage of current smokeless tobacco users among the sexes is similar; men (4 percent) and (3 percent).

Table 3.3.9 details current smokeless tobacco users by selected demographic characteristics. Five percent of the respondents residing in rural areas are currently using smokeless tobacco while only 2 percent of respondents residing in urban areas are using smokeless tobacco. Respondents with no formal education comprise the highest users of smokeless tobacco at 15 percent. Among the wealth quintiles, the poorest respondents have the largest percentage of current smokeless tobacco use at 9 percent.

Tobacco Smoking Cessation

Figure 3.3.1 shows the distribution of current smokers who have attempted to quit smoking in the past 12 months. Thirty five percent of the current smokers have tried to stop smoking in the past 12 months.

Figure 3.3.1: Percentage of current smokers who have tried to stop smoking in past 12 months

Table 3.3.12 indicates the distribution of current smokers who have attempted to quit smoking in the past 12 months by selected demographic characteristics. Forty two percent and 26 percent of the residents residing in rural and urban areas respectively have attempted to quit smoking in the past 12 months. Respondents with no formal education constitute the highest proportion (47 percent) of those who have tried to stop smoking in the past 12 month. Only one in five of the respondents from the richest quintile have attempted to quit smoking in the past 12 month.

Exposure to second hand smoking

Respondents exposed to second hand smoking in the home during the past 30 days are detailed in table 3.3.14. Nearly a quarter (24 percent) of the respondents (including current smokers) reported having been exposed to second hand smoking in their homes at least once, with more men (30 percent) than women (18 percent) being exposed.

Table 3.3.14: Percentage of respondents exposed to second-hand smoke in the home

3.3.2 Alcohol consumption

Distribution of Alcohol Consumption

Distribution of alcohol consumption among the respondents is shown in table 3.3.17. Nineteen percent of respondents are current drinkers of alcohol with a significant difference between the sexes (34 percent of men against 5 percent of women). Three in five respondents are lifetime abstainers with the percentage of abstinence among women being nearly twice that among men (80 percent and 41 percent respectively). Age group 30-44 among the men constitute the highest consumers of alcohol at 44 percent.

The percentage of current drinkers among the urban residents is twenty three percent and among the rural residents is seventeen percent. The richest quintile has the highest proportion of current drinkers (24 percent) see Appendix Table B2 .

Frequency of Alcohol Consumption past 7 days

Thirteen percent of current alcohol drinkers consume alcohol daily. Nearly half of current drinkers consume alcohol 1 to 2 days in a week, while eight percent consumed for 5 to 6 days as shown in table 3.3.18. Sixteen percent of current drinkers did not consume alcohol at all during the whole week.

3.3.3 Diet

Consuming a healthy diet throughout the life-course helps prevent malnutrition in all its forms as well as a range of non-communicable diseases and conditions. However, the increased production of processed foods, rapid urbanization and changing lifestyles have led to a shift in dietary patterns. People are now consuming more foods high in energy, fats, free sugars or salt/sodium, and many do not eat enough fruit, vegetables and dietary fiber such as whole grains. (WHO, 2015)

This survey asked respondents questions on the following areas of interest and are covered in this section; fruits and vegetable consumption, dietary salt intake, dietary sugar intake, and consumption of oils and fats at the household level.

Fruits and vegetable consumption

Mean number of days of fruit consumption in a typical week

Respondents' were asked about their fruit and vegetable intake in a typical week and on how many servings of fruit and vegetables they consumed on one of these days. The World Health Organization (WHO) recommends at least 400g (5 portions) of fruits and vegetables a day (WHO, 2015).

Table 3.3.28 below shows the distribution of mean number of days of fruit consumption among the respondents by age and sex. The mean consumption of fruits among the respondents is 2.5 days per week

Table 3.3.28: Mean number of days of fruit consumption

Fruit and vegetable servings on average per day

The World Health Organization (WHO) recommends at least 5 servings of fruits and vegetables a day. Table 3.3.32 below shows the mean number of servings of fruit and vegetables on an average day. Overall, respondents report an average daily consumption of two servings (2.1) of fruit and vegetables consistently across all age groups.

Table 3.3.32: Mean number of servings of fruit and/or vegetables on average per day

Number of servings of fruit and vegetables on average per day

This survey observes that 18 percent of the male respondents and 20 percent of female respondents have no fruit and/or vegetable intake per day and only 7 percent of the male respondents and 5 percent of the female respondents report consuming more than five servings of fruit and/or vegetables per day.

Salt intake

Salt provides our body with the vital mineral sodium, that works together with potassium, (a mineral naturally contained in our body cells) to maintain normal blood pressure and normal function of muscles and nerves. The WHO recommendation on sodium consumption is <2g/day (5g of salt per day). This is because sodium is associated with fluid retention in the body cells, resulting to high risk onset of increased blood pressure leading to hypertension and cardiovascular diseases. Reducing salt intake has been identified as one of the most cost effective measures a country can take to improve population health outcomes.

Respondents who add salt always to food

Overall, 23 percent of respondents add salt always or often before eating or when eating with a higher proportion among men (26 percent) than women (20 percent). Men in age group 18-29 present the highest proportion (29 percent) of adding salt always or often before eating or when eating.

Table 3.3.35: Percentage of respondents who add salt always or often before eating or when eating

Age Group (years)	Men			Women			Both Sexes

Consumption of processed foods high in Salt

WHO reports that most salt consumed comes from processed foods (e.g. processed foods like bacon, ham and salty snacks) or foods consumed frequently in large amounts such as bread.

Table 3.3.37 below shows the distribution of the consumption of processed foods high in salt. Four percent of respondents always or often consume processed food high in salt with no significant sex difference. Consumption of processed foods decreases with advancing age.

Table 3.3.37: Percentage of respondents who always or often consume processed food high in salt

Consumption of processed foods high in Salt in relation to the place of residence, wealth quintile and the level of education

It was noted that 3 percent of rural residents and 6 percent of urban residents always or often consume processed foods high in salts. Respondents from the fourth wealth quintile have the highest percentage (7 percent) of those who always or often consume processed food high in salt (Appendix Table B4 and Table B5).

Respondents perception and knowledge on Salt consumption

Table 3.3.38 below shows respondents perception and knowledge on amount of consumed. Eleven percent of respondents think they consume far too much or too much salt. Men in age group 30-44 years represent the highest percentage (14 percent) of those who think they consume far too much or too much salt. Sixty nine percent of respondents perceive their consumption of salt to be just the right amount with the highest proportion (72 percent) being in the age groups 18-29 years.

Table 3.3.38: Perception of amount of salt consumed

Respondents perception on the importance of Lowering salt in the diet

Nearly half (49 percent) of respondents perceive lowering salt in the diet as being very important. Twenty four percent of the respondents do not think that reducing salt in the diet is important at all. Perception of the importance of lowering salt in the diet increased with advancing levels of education (Appendix Table B6)

Respondents Knowledge of the dangers of high Salt intake

Table 3.3.39 below shows the percentage of respondents who think that too much salt can cause a health problem. Seventy eight percent of all respondents think that consuming too much salt could cause serious health problem with no sex differences.

Table 3.3.39: Knowledge on dangers of high salt intake

Dietary sugar intake

The World Health Organization recommends limiting of the intake of free sugars to <10% of total energy intake which is equivalent to 50g (around 12 level teaspoons) per day. Ideally, free sugar consumption of <5% of total energy intake has additional health benefits. Sources of free sugar include sweetened foods and drinks, naturally occurring sugars present in honey, syrups, fruit juices and fruit juice concentrates (WHO, 2015).

The World Health Organization recommends limiting of the intake of free sugars to <10% of total energy intake which is equivalent to 50g (around 12 level teaspoons) per day. Ideally, free sugar consumption of <5% of total energy intake has additional health benefits. Sources of free sugar include sweetened foods and drinks, naturally occurring sugars present in honey, syrups, fruit juices and fruit juice concentrates (WHO, 2015)

In this section respondents were asked on the following in the regard to dietary sugar intake: Always add sugar to beverages, add sugar always or often when cooking or preparing food at home, always consume processed food high in sugar, self reported quantity of sugar consumed, importance of lowering sugar in diet, think consuming too much sugar could cause serious health problem. The survey also asked the respondents on the strategies to minimize the amount of sugar used in beverages such as limiting consumption of soda and sugary drinks, limiting consumption of processed foods, use of natural or unrefined alternatives, and any other strategies to control sugar intake.

Respondents who always add sugar to beverages

Table 3.3.45 below shows percentage of respondents who always add sugar to beverages. Twenty eight percent of respondents always add sugar to beverages. Men in age group 18-29 have the highest proportion (32 percent) of respondents who always add sugar to beverages.

Table 3.3.45: Percentage of respondents who always add sugar to beverages

Respondents who consume processed foods

Two percent of the respondents always consume processed food high in sugar, with the highest proportion (3 percent) being among women age 18-29 years (Appendix Table B8).

Self-reported quantity of sugar consumed

Table 3.3.47 below shows the percentage of the respondents' perception of the quantity of sugar they consume. Sixty three percent of respondents perceive their sugar consumption to be just the right amount while 14 percent perceive they consume too much sugar.

Table 3.3.47: Self-reported quantity of sugar consumed

Importance of lowering sugar in diet

Fifty percent of the male and 51 percent of female respondents report that it is very important to lower sugar in diet while 17 percent of male and 16 percent of female respondents report that it is not important at all. (Appendix Table B9)

Respondents perception on harm caused by consuming too much Sugar

Table 3.3.48 below shows the distribution of the respondent's perception on the harm caused by consumption of too much sugar. Eighty five percent of male and 83 percent of female respondents think consuming too much sugar could cause serious health problems with the highest proportion (86 respondents) being among those in the age group 18-29 years

Table 3.3.48: Percentage of respondents who think consuming too much sugar could cause serious health problem

Strategies to Control sugar intake in the diet

Minimize the amount of sugar used in beverages

Table 3.3.49 below shows the distribution of respondents who minimize sugar used in beverages. Fifty four percent of respondents control their sugar intake by minimizing the amount of sugar used in beverages, with women in the age group 45-59 having the highest percentage (60 percent).

Table 3.3.49: Percentage of respondents minimizing sugar used in beverages

Dietary Fats and oils

Reducing the amount of total fat intake to less than 30 percent of total energy intake helps prevent unhealthy weight gain in the adult population. The risk of developing NCDs is lowered by reducing saturated fats to less than 10 percent of total energy intake, and trans-fats to less than 1 percent of total energy intake, and replacing both with unsaturated fats (WHO, 2015).

This survey asked respondents on the type of oil or fat most often used for meal preparation in household as a strategy to limit consumption of fats and fatty acids in their diet.

Type of oil used most frequently

Figure 3.3.2 below shows the distribution of type of oil used for meal preparation in the household.

Vegetable oil usage has the highest proportion at 60 percent while 39 percent of the respondents use lard as a source of oils or fats used for meal preparation at home.

Figure 3.3.2: Type of oil used for cooking

Meals not prepared at home

Table 3.3.53 below shows the distribution of respondents who consume meals not prepared at home. The mean number of meals taken outside home by all the respondents was approximately 2 meals per week. There is a difference between men (3 meals) and women (1 meal) on the number of meals eaten not prepared at home per week.

Table 3.3.53: Mean number of meals eaten not prepared at home

Age Group (years)	Men			Women			Both Sexes		
	n	mean	95% CI	n	mean	95% CI	n	mean	95% CI
18-29	555	3.1	2.4-3.8	936	1.0	0.8-1.2	1491	2.0	1.6-2.4
30-44	721	3.4	2.9-3.9	988	1.0	0.8-1.3	1709	2.2	1.9-2.6

60-69	159	1.2	0.8-1.6	255	0.5	0.3-0.7	414	0.8	0.6-1.0
18-69	1789	3.0	2.6-3.4	2698	0.9	0.8-1.1	4487	1.9	1.7-2.2

Meals eaten not prepared at home was higher in the urban (3) than rural areas (2). Respondents from of the richest wealth quintile have the highest mean number of meals eaten not prepared at home (Appendix Table B10).

3.3.4 Physical Activity

World Health Organization (WHO) defines physical activity as any bodily movement produced by skeletal muscles that requires energy expenditure – including activities undertaken while working, playing, carrying out household chores, travelling, and engaging in recreational pursuits.

The term "physical activity" should not be confused with "exercise", which is a subcategory of physical activity that is planned, structured, repetitive, and aims to improve or maintain one or more components of physical fitness. Both, moderate and vigorous intensity physical activity brings health benefits. In order to be beneficial for cardio- respiratory health, all activity should be performed in bouts of at least 10 minutes duration.

WHO recommends that adults aged 18–64 years should do at least 150 minutes of moderate-intensity physical activity throughout the week, or do at least 75 minutes of vigorous-intensity physical activity throughout the week, or an equivalent combination of moderate- and vigorous-intensity activity. Adults age 65 years and above should follow the recommendations of the above age group and in addition do the following; those

with poor mobility should perform physical activity to enhance balance and prevent falls, 3 or more days per week and perform muscle-strengthening activities involving major muscle groups, 2 or more days a week. However during analysis in this survey for respondents above we only considered the same recommendations as for persons as 18-64 years.

This survey asked respondents questions on the following areas of interest and are covered in this chapter; Level of total physical activity according to WHO recommendations on physical activity for health; Level of total physical activity according to former recommendations; duration of the physical activity; physical activity at the work place; physical activity during travel; physical activity during leisure time and sedentary behavior

Levels of total physical activity using former WHO recommendations

Table 3.3.55 below shows the levels of total physical activity based on a combination of physical activity done as part of work, transport and leisure time. Eleven percent of respondents have a low level of total physical activity, 15 percent are moderately active while 75 percent have a high level of physical activity. Respondents in the age group 60-69 are least active.

Table 3.3.55: Level of total physical activity

Age Group (years)	Men						
	n	% Low	95% CI	% Moderate	95% CI	% High	95% CI

Respondents who reside in rural areas spend more time on work-related physical activity (237.4 minutes per day) compared with urban (212.4 minutes per day) residents. Respondents in the richest quintile have the lowest mean minutes of work-related physical activity (Appendix Table B12)

Transport-related physical activity

Table 3.3.60 below shows the distribution of mean minutes spend on transport-related physical activity by age group and sex. Overall, respondents spend 53 minutes in transport-related physical activities with men reporting 60 minutes and women 45.4 minutes.

Table 3.3.60: Mean minutes spent on transport-related physical activity on average per day

Age Group (years)	Men			Women			Both Sexes

Table 3.3.63 below shows the distribution of mean minutes spent on recreation-related physical activities by residence. It is worth noting that there is no difference in the mean minutes spent on recreation-related physical activity between the rural and urban residents. Respondents in the richest quintile spend the highest mean minutes of recreation-related physical activity (13 minutes per day).

3.4 Past Medical History

3.4.1 Raised Blood Pressure or Hypertension

Raised blood pressure (hypertension) is defined as systolic blood pressure ≥ 140 mm Hg and/or diastolic blood pressure ≥ 90 mm Hg (WHO). Respondents were asked if they had ever had their blood pressure measured by a doctor or other health worker and for those measured if they had been diagnosed with hypertension.

More than half (56 percent) of the respondents had never been measured for hypertension (HTN) with the highest percentage reported among those in age group 18-29 years (62 percent). Approximately 5 percent of the respondents reported to have ever been diagnosed with hypertension in the past 12 months. Seventy one percent of men and 41 percent of women had never been screened for hypertension. For both sexes the age group less likely to be screened is 18-29 years while the age group 60-69 years has the highest percentage of being screened as shown in Table 3.4.1 below.

Table 3.4.1: Previous diagnosis of raised blood pressure /HTN

Age Group (years)	Men								
	N	% Never measured	95% CI	% measured, not diagnosed	95% CI	% diagnosed, but not within past 12 months	95% CI	% diagnosed within past 12 months	95% CI

Table 3.4.2 highlights the percentage of respondents who have never been screened for raised blood pressure (BP)/hypertension by residence and wealth status. Sixty one percent of the respondents residing in rural areas had never been screened compared with 48 percent of those residing in the urban areas. Respondents in the poorest wealth quintile were more likely not to have been screened for elevated BP (73 percent) compared with the highest quintile (38 percent)

Table 3.4.2: Previous diagnosis of raised BP/HTN by residence and wealth status

Currently on treatment

Respondents who reported to have been previously diagnosed were asked if they were currently on treatment (had been taking medication for hypertension prescribed by a health worker in the past two weeks). Table 3.4.4 below shows the proportion of respondents who reported to have been diagnosed with hypertension and were on treatment. Among those who reported to have been diagnosed with hypertension, only 22 percent were currently on medication prescribed by a health worker; a higher percentage of women (24 percent) than men (18 percent) were on treatment.

Table 3.4.4: Percentage of respondents currently taking drugs (medication) prescribed by doctor or health worker

Among respondents on treatment for hypertension, one percent were currently taking herbal or traditional remedy. Six percent of men age 60-69 were currently taking herbal or traditional remedy compared with 3 percent of women in the same age group (Appendix Table B13)

3.4.2 Diabetes Mellitus

Diabetes mellitus (DM) is a chronic metabolic disorder characterized by elevated blood sugar resulting from defects in insulin secretion, insulin action or both (MOPHS, 2010). A diagnosis of diabetes mellitus is made based on measurement of a blood sugar either after fasting or as a random measure. A fasting blood glucose level of >7 mmol/l is considered diagnostic of diabetes mellitus while a level of 6.1-7mmol/l is known as impaired fasting glycemia (pre-diabetic state).

Respondents were asked if they had ever had their blood glucose measurement taken and if so whether they had been diagnosed with DM.

Table 3.4.5 shows the percentage of respondents who have been measured for raised blood sugar/DM Overall, 88 percent of the respondents had never been measured for raised blood sugar. Less than 1 percent of the respondents have been diagnosed with raised blood sugar in the past 12 months.

Table 3.4.5: Percentage of respondents who have been measured for Raised Blood Sugar

Age Group (years)	Men								
	N	% Never measured	95% CI	% measured, not diagnosed	95% CI	% diagnosed, but not within past 12 months	95% CI	% diagnosed within past 12 months	95% CI

Respondents in the highest wealth quintile were more likely to have been screened for elevated blood sugar as shown in the Appendix Table B14.

Respondents with no formal education have the highest percentage of those who have never been measured as shown in Appendix Table B15.

Currently on treatment

Respondents who reported to have been diagnosed with DM were asked if they were currently on treatment (had been taking medication for DM prescribed by a health worker in the past two weeks).

Tables 3.4.6 below show the percentage of respondents who reported to have been diagnosed with diabetes and were on treatment. Among those diagnosed with elevated blood sugar/DM, less than half (40 percent) were currently taking medication. There was a marked variation in current medication use between women (57 percent) and men (17 percent) while those age 30-44 years reported the highest current use (67 percent).

Table 3.4.6: Percentage of respondents currently taking medication among those previously diagnosed with DM

Age Group (years)	Men			Women			Both Sexes		
	N	% taking meds	95% CI	N	% taking meds	95% CI	n	% taking meds	95% CI

*Indicates estimate based on less than 25 unweighted cases and has been suppressed.

A higher percentage of respondents who had been diagnosed with DM and were currently on treatment reside in the urban at 54 percent compared with rural residents at 28 percent as shown in Figure 3.4.1 below.

Fig 3.4.1: Percentage of respondents diagnosed with DM and currently on medication

Five percent of the respondents who had been diagnosed with diabetes were currently using herbal therapy or treatment (Appendix Table B16).

3.4.3 Raised Total Cholesterol

Elevated total blood cholesterol is one of the modifiable risk factors for the development of the major non-communicable conditions such as cardiovascular disease, diabetes and many cancers. Blood cholesterol test profiles is usually categorized into low-density lipoprotein cholesterol (LDL), high-density lipoprotein cholesterol (HDL) and triglycerides.

Nearly all, (98 percent) of the respondents had never been measured for cholesterol levels and the percentage of those never been measured was lowest among those age 45-59 (94 percent) as shown in table 3.4.8 below.

Table 3.4.8: Percentage of Respondents measured for raised Total Cholesterol

Age Group (years)	Men

3.5 Cervical Cancer Screening

Awareness of Cervical Cancer Screening

Cancer of the cervix is a leading cause of cancer deaths in developing countries as well as one of the top cancers affecting women in Africa. Early detection has been shown to prevent up to 80 percent of cervical cancers. Screening is therefore recommended for every woman age 30 to 49 at least once in her lifetime and ideally more frequently (WHO Fact Sheet No 380, 2015). Some of the common tests used for cervical cancer screening include Visual Inspection with Acetic Acid (VIA), Visual Inspection under Lugol's Iodine (VILI), Pap smear and the Human Papilloma Virus test.

Table 3.5.1 presents the proportion of respondents' age 18-69 years who have ever heard of cervical cancer screening. Overall, 43 percent of the respondents have ever heard of any of the three cervical cancer screening methods. Women in age group 30-44 have the highest percentage of women who have ever heard of cervical cancer screening. More women (47 percent) were aware of cervical cancer screening than men (40 percent).

Table 3.5.1: Percentage of respondents who have ever heard of cervical cancer screening

Age Group (years)	Men			Women			Both Sexes		
	n	%	95% CI	n	%	95% CI	n	%	95% CI
18-29	550	38.4	31.9-45.0	926	44.8	38.6-51.0	1476	41.8	36.2-47.3
30-44	710	38.8	32.5-45.2	979	50.9	44.9-57.0	1689	44.9	40.0-49.9
45-59	348	45.6	36.5-54.7	509	46.6	39.1-54.2	857	46.1	39.2-53.1
60-69	153	33.3	24.8-41.8	251	39.7	28.8-50.6	404	36.6	29.3-43.9
18-69	1761	39.5	34.0-45.0	2667	46.8	41.6-51.9	4426	43.2	38.4-48.1

Approximately 61 percent of the respondent in the richest quintile have heard of cervical cancer screening compared with 22 percent among the poorest as illustrated in Appendix Table B17.

Life time screening among all the women

Table 3.5.2 shows the percentage of women who had ever been screened for cervical cancer. Overall, 11 percent reported having had a screening test done. Women in age group 30 – 44 years have the highest percentage of those who had ever been screened for cervical cancer (17 percent)

Table 3.5.2: Prevalence of women who have ever been screened for cervical cancer

Age Group (years)	Women		
	n	% ever tested	95% CI
18-29	934	7.3	4.3-10.2
30-44	987	16.6	12.8-20.5

60-69	254	8.0	3.5-12.4
18-69	2694	11.3	8.8-13.9

Life time screening among all the women age 30-49 years

Table 3.5.3 below shows the uptake of screening services among women age 30-49 years based on residence, wealth quintile and education level. Overall, 16 percent of women age 30-49 years have ever been screened for cervical cancer. Twenty three percent of women in urban areas have been ever screened compared with 14 percent in rural areas. The percentage of women who had ever been screened was noted to increase with advancing level of education.

Table 3.5.3: Percentage of women age 30-49 years who have ever been screened for cervical cancer by selected demographic characteristic

3.7 Healthy Lifestyle Advice

Health workers play a major role in the prevention of non communicable diseases by educating their clients on the need to adopt healthy lifestyles. The STEPS survey sought to assess from the respondents if they had been given lifestyle advice by a health care worker. In this survey respondents were asked if they had been advised by a health worker to either avoid engaging in a certain risky behavior or encouraged to adopt healthy habits that reduce their risk of developing NCDs.

Figure 3.7.1 below shows the percentage of respondents age 18-69 years who had been given advice by a health worker relating to the four major NCD behavioral risk factors in the past three years. Only eight percent of the respondents had been advised against tobacco use. Overall, 10 percent of the respondents have been advised to either stop drinking alcohol or not to start drinking alcohol by a health care worker. Twenty one percent of the respondents have received advice to eat adequate fruits and vegetables.

Fig 3.7.1: Percentage of respondents receiving healthy advice

3.8 Physical Measurement

Overweight and Obesity

Overweight and obesity refer to abnormal accumulation of fat in the body that may impair health. Body mass index (BMI) is a simple index of weight-for-height that provides population-level measure of overweight and obesity as it is the same for both sexes and for all ages of adults. It is defined as a person's weight in kilograms divided by the square of his height in meters (kg/m²). A person whose BMI is greater than or equal to 25 is considered overweight while one with a BMI greater than or equal to 30 is considered obese. See Appendix Table B18 for further classification

Overweight and Obesity

Overweight and obesity are a major risk factor for noncommunicable diseases such as cardiovascular diseases, diabetes and some types of cancer. In this survey, respondents had their weight and height measurements taken using a portable BMI scale.

Table 3.8.1 shows the percentage of respondents who had a BMI ≥ 25 and were thus considered either overweight or obese. Twenty-eight percent of the respondents are either overweight or obese with a significantly higher percentage of women (39 percent) being overweight or obese compared with men (18 percent).

Table 3.8.1: Prevalence of Overweight and Obesity

Age Group (years)	Men			Women			Both Sexes		
	N	% BMI ≥ 25	95% CI	n	% BMI ≥ 25	95% CI	n	% BMI ≥ 25	95% CI
18-29	552	11.7	7.2-16.2	839	31.4	26.3-36.5	1391	21.5	18.5-24.5

Table 3.8.2 shows the Percentage of respondents in each BMI classification. Overall, 61 percent have BMI 18.5-24.9 which is normal weight. Nine percent of the respondents have BMI above 30 (obese) while 19 percent have BMI 25.0-29.9 (overweight). Women are more likely to be obese (14 percent) and overweight (25 percent) than the men obese (4 percent) and overweight (13 percent).

Table 3.8.2: Percentage of respondents in each BMI classification

Table 3.8.3 shows the percentage of respondents in each BMI classification by residence. The survey results shows that respondents residing in urban areas (25 percent) are more likely to be overweight than those residing in rural areas (16 percent). Twelve percent of respondents from urban settlements were obese while 7 % of rural dwellers are obese.

Table 3.8.3: Prevalence of overweight and obesity by residence

Residence	BMI class

The percentage of overweight and obesity increases with increase in education level and increase in wealth (Appendix Table B19)

Waist and Hip Measurements

Waist Circumference

The respondents' waist circumference is detailed in table 3.8.4. The mean waist circumference for men is 78.6 while for women is 79.1

Table 3.8.4: Mean Waist Circumference

Waist–hip ratio

Waist–hip ratio (the waist circumference divided by the hip circumference) is an index used to identify individuals at increased risk of obesity related morbidity due to accumulation of abdominal fat (WHO, 2011). Women whose waist hip ratio (WHR) is ≥ 0.85 and men with a WHR ≥ 0.9 are considered to be at increased risk of obesity-related morbidity.

Table 3.8.5 below shows the percentage of respondents waist hip ratio above the normal values by sex and age group. Twenty eight percent of the men and 36 percent of the Kenyan women had a higher Waist–hip ratio than recommended.

Table 3.8.5: Percentage of respondents waist hip ratio by sex and age group

TOTAL	2525	35.9	32.4-39.3

Blood pressure measurement

Elevated blood pressure is one of the major risk factors for development of cardiovascular diseases. In this study, respondents blood pressure measurement was taken using battery powered digital blood pressure machines. Three readings were taken 3-5 minutes apart with the last reading being recorded as the respondent's blood pressure.

Mean Systolic and Diastolic Blood Pressure

Overall the mean systolic blood pressure of the respondents is 124mmHH while the diastolic is 80mmHH. The mean systolic blood pressure is significantly higher among the men (127 mmHg) than women 122 (mmHg) (Appendix Table B20 and Appendix Table B21).

Prevalence of Raised Blood Pressure

Twenty four percent of the respondents have raised blood pressure (raised blood pressure is defined as SBP \geq 140 and/or DBP \geq 90 mmHg or currently on medication for raised BP). The highest prevalence was reported among those age 60-69 years (53 percent) with women age 60-69 years having a prevalence of 58 percent compared with men in the same age group (49 percent) as shown in the table 3.8.6 below

Table 3.8.6: Percentage of Respondents with Raised Blood Pressure or currently on medication

Table 3.8.8 shows the percentage of respondents with raised blood pressure on medication. Overall, 92 percent of people living with hypertension are not on treatment with 97 percent of those age 18-29 years not being on treatment. Among respondents living with hypertension only three percent are well controlled with the level of control noted to improve with increasing age as shown in the table below. The percentage of men not on treatment (95 percent) is higher than that of women (88 percent).

3.9 BIOCHEMICAL MEASUREMENTS

Blood Glucose Measurements

In this survey respondents had their blood glucose levels measured after at least 12 hours of fasting. Testing was performed using a Cardiocheck machine which used test strips for both blood glucose and lipid profile (total Cholesterol and HDL Cholesterol). Blood sample was collected via a minimally invasive figure prick.

Mean Fasting Glucose

The survey showed that the mean fasting glucose is 4.6 mmol/l. There was no significant difference in mean fasting glucose between the sexes (Appendix Table B22).

Prevalence of Impaired fasting Glycaemia

Table 3.9.1 shows the prevalence of impaired fasting glycaemia. Overall, three percent of the respondents had impaired fasting glycaemia. The age group 60-69 has the highest percentage of impaired fasting glycaemia (7 percent).

Table 3.9.1: Prevalence of Impaired Fasting Glycaemia*

Prevalence of Raised Blood Glucose

Table 3.9.2 below shows the prevalence of respondents who have raised blood glucose/DM or are on treatment for diabetes by age group and sex. Two percent of the respondents have either raised fasting blood glucose (FBG) or are currently on treatment for diabetes. The highest percentage of raised FBG was found among the age group 45-59 years (5 percent).

Table 3.9.2: Prevalence of raised blood glucose or currently on medication for

Blood Cholesterol Measurements

Mean total cholesterol

The overall mean total cholesterol is 3.6 mmol/L (males 3.4 mmol/L and females 3.8 mmol/L). Age group 45-59 has the highest mean at 4.0 (Appendix Table B23).

Prevalence of raised total cholesterol

There are no standard cut-off points for total cholesterol levels but in many developed countries values below 5.0 mmol/L are considered normal while values above 6.2 mmol/L are considered high (Mayo Clinic).

In this survey, respondents had their total and HDL Cholesterol levels measured after at least 12 hours of fasting using a Cardiocheck machine and test strips for lipid profile. The percentage of respondents with total cholesterol ≥ 5.0 mmol/L or currently on medication for raised cholesterol is shown in table 3.9.4. Approximately one in ten respondents have cholesterol ≥ 5.0 mmol/L or are currently on medication for raised cholesterol. The percentage is slightly higher among the women (13 percent) compared with men (7 percent). The age group 60-69 have the highest percentage of raised cholestral at 17 percent.

Table 3.9.4: Percentage with Total Cholesterol \geq 5.0 mmol/L or currently on medication for raised cholesterol

18-69	1646	1.1	0.4-1.9	2523	1.8	1.1-2.5	4169	1.5	1.0-2.0

Prevalence of low HDL cholesterol

HDL is considered the ‘good’ cholesterol. Values of HDL cholesterol below 1.03 mmol/L for men and 1.29 mmol/L for women are abnormal, while those above 1.5 mmol/L are normal for both sexes (Mayo Clinic).

Figure 3.9.1 below shows the percentage of respondents who have abnormal levels of HDL cholesterol. Half of all men (50 percent) more than half of the women (60 percent) had abnormal HDL levels.

3.10 Combined risk factors

Population risk of developing cardiovascular disease

The total risk of developing cardiovascular disease (CVD) is determined by the combined effect of behavioral and biological risk factors (for instance smoking, or having raised blood sugar), age and sex. An individual with several mildly raised risk factors may be at a higher total risk of CVD than someone with just one elevated risk factor, for instance raised blood pressure. Using total CVD risk instead of a single risk factor means that resources can be spent on those who benefit the most (those with a high risk) instead of treating those with a very low risk of morbidity and mortality.

In this report, the WHO risk estimation model for CVD where age, sex, smoking, blood pressure, blood cholesterol, and presence of diabetes serves as basis for estimating the 10 year risk of a fatal or non-fatal cardiovascular event (meaning death from, or developing cardiovascular disease) is used. A risk at or above 30 percent is considered high and cost-effective to treat.

Table 3.10.1 below shows the percentage of respondents who have a CVD risk of 30 percent or above. Eight percent of the respondents in the 40-69 age group have a CVD risk of 30 percent or above with a higher proportion of women (9 percent) than men (7 percent) being at risk.

Table 3.10.1: Percentage of respondents' age 40-69 yrs with a 10-year CVD risk $\geq 30\%$ or with existing CVD

3.11 Injuries

An injury is a harmful event in which a transfer of energy results in tissue damage. They can be due to impact from objects, an acute exposure to physical agents such as mechanical energy, heat, electricity, chemicals and ionising radiation interacting with the body in amounts and at rates that exceed the threshold of human tolerance.

Injuries remain a significant public health concern affecting a wide variety of risk groups e.g. elderly, youth, workers, pedestrians for whom continual focus on research and prevention will yield important health benefits. There is need for experienced staff, innovative approaches and analysis expertise to address the public health challenge.

Injuries can be classified according to mode of causation;

Three broad categories

- Unintentional (accidental)
- Intentional (deliberate)
- Undetermined intent

Unintentional Injuries

Road Safety

Road traffic injuries (RTI) are one of the major causes of mortality among all the injuries. Additionally, RTI cause considerable economic losses to victims, their families and to the nation as a whole. RTI are largely preventable by use of various methods such as seatbelt use, helmet use, avoiding of drink driving among others.

Seatbelt Use

Seat belts are a vital part of safety in vehicles hence should be present and functional in all vehicles. The following are benefits of wearing a seat belt; provides security, prevents dangerous injuries and lowers medical costs.

Table 3.11.1 shows percentage of drivers or passengers not always using a seat belt. Eighty eight percent of the respondents do not always use a seat belt. Ninety percent and 85 percent of women and men respectively do not always use a seat belt.

Table 3.11.1: Percentage of drivers or passengers not always using a seat belt

Age Group (years)	Men			Women			Both Sexes		
	N	% Not always using seat belt	95% CI	n	% Not always using seat belt	95% CI	n	% Not always using seat belt	95% CI

Helmet Use

Wearing a helmet is the single most effective way of reducing head injuries and fatalities resulting from motorcycle and bicycle crashes. Wearing a helmet has been shown to decrease the risk and severity of injuries among motorcyclists reduces the likelihood of death and substantially reduces the costs of health care associated with such crashes (Ma-leod, Digiacomo, & Tinkoff, 2010)

The table 3.11.2 below shows the percentage of motorcycle or a motor-scooter driver/-passengers who do not always wear helmets. It is noted that 94 percent of the respondent do not always wear helmets. Women are more likely not to always wear a helmet than their male counterpart (98 percent Vs 90 percent).

Drink driving

Driving under the influence of alcohol is dangerous as it impairs judgment and reduces reaction time.

The percentages of drivers who reported to have driven under the effects of alcohol is detailed in table 3.11.4 below. The survey results indicates that 3 percent of the respondents reported to have driven under the influence of alcohol in the past 30 days. Five percent men reported to have driven under the influence of alcohol compared with women at 2 percent. The highest percentage of respondents among men who reported to have driven under the influence of alcohol is in the age group 18-29 years (7 percent).

Table 3.11.4: Percentage of respondents who reported driving under the effects of alcohol

Road Traffic crashes

The table 3.11.6 below shows the percentage of respondents involved in road traffic crash within the past 12 months. It is noted that 6 percent of all the respondents were involved in a road traffic crash. The age group 18yrs -29 has the highest percentage of involvement in a road traffic crash followed by 30-44. Men are more likely (9 percent) to be involved in road traffic crash than women (3 percent).

Table 3.11.6: Percentage of respondents involved in a road traffic crash during the past 12 months

Age Group (years)	Men			Women			Both Sexes

The table 3.11.7 below shows percentage of respondents involved in a road traffic crash according to residence during 12 months prior to the survey. It is noted that 7 percent are from the urban compared with 5 percent from the rural areas.

Table 3.11.7: Percentage of respondents involved in a road traffic crash during the past 12 months by residence

residence	Both sexes	
	n	% Involved in road traffic crashes
Rural	2303	4.8
Urban	2184	7.2
TOTAL	4487	5.8

The table 3.11.8 below shows the percentage of the respondents seriously injured as a result of road traffic crash among those involved in a road traffic crash. Serious injuries were described as injuries that required medical attention. The table indicates that 54 percent of all the respondents who were involved in a road traffic crash were seriously injured. Men account for 59 percent compared with women at 41 percent.

Table 3.11.8: Percentage of respondents seriously injured as a result of road traffic crash among those involved in a road traffic crash

Injuries other than road traffic Injuries

The table 3.11.9 below shows the percentage of the respondents who were seriously injured accidentally in the past 12 months. The survey results indicates that 10 percent of all respondents were seriously injured in other injuries other than road traffic injuries. Respondents in the age group 45-59 years have the highest percentage of injury comprising 13 percent.

Table 3.11.9: Percentage of respondents seriously injured in a non-road traffic accident

Types of unintentional injuries

The table 3.11.10 shows the percentages of respondents who were seriously injured by types of injuries. The table indicates that injuries resulting from cuts are the leading cause of injuries (48 percent), followed by falls (34 percent). Fifty six percent of respondents age 30-44yrs and 51 percent of respondents' age 18-29 years were more likely to get cut.

Place of injury

Table 3.11.11 below shows the percentage of various locations where the serious unintentional injuries occurred. Majority of the injuries occurred at home (41 percent) followed by school/workplace (21 percent). The highest percentage of those injured at home is age group 60-69 years at 52 percent. Women respondents comprising 51 percent are more likely to be injured at home compared with men at 33 percent. In contrast more men (28 percent) are more likely to be injured at the workplace/school than women (12 percent).

Violence/Intentional injuries

Violence is described as "the intentional use of physical force or power, threatened or actual, against oneself, another person, or against a group or community that either results in or has a high likelihood of resulting in injury, death, psychological harm, maldevelopment or deprivation". Interpersonal violence as an act of violence inflicted by another individual or by a small group of individuals, and self-directed violence is defined as an act of violence inflicted upon oneself (Daher, 2002)(Krug et al., 2002).

The table 3.11.12 below shows the percentage of respondents involved in a violent incident resulting in a serious injury. Overall, 4 percent of the respondents were involved in violent incident resulting in a serious injury in the past 12 months. Men are more likely (5 percent) to have in violent injuries compared with women at 3 percent. The survey results further shows that the age group 30-44 years had the highest occurrence (6 percent) of violent injury while age group 60-69 years had the least occurrence (1 percent).

Table 3.11.12: Percentage of respondents seriously injured from violent incidents

Age Group (years)	Men			Women			Both Sexes		
	N	% Seriously injured from violent incidents	95% CI	n	% Seriously injured from violent incidents	95% CI	n	% Seriously injured from violent incidents	95% CI

Respondents from the richest quintile have the lowest percentage of being involved in a serious violent injury. Respondents with primary education incomplete have the highest percentage of involvement in a serious violence injury (Appendix table B24).

The table 3.11.13 below shows the percentage of violent incident caused by firearms, other weapons and without a weapon. It is noted that 59 percent of all the violently injured persons were injured without a weapon. Less than 1 percent of the injuries were caused by a firearm. Majority of the men were injured without a weapon (64 percent) in contrast to majority of women who were injured with a weapon (52 percent).

Persons causing violent injury

Table 3.11.14 below shows the perpetrators of the violent injury in relation to the victim. The survey shows that most of the injuries were caused by a friend or acquaintance accounting for 23 percent followed by stranger at 22 percent. The most affected age group due to intimate partner is 60-69 years comprising 47 percent. Women respondents are more (45 percent) likely to be injured by intimate partner compared to men (33 percent).

3.12 Oral Health

The WHO defines oral health as a state of being free from chronic mouth and facial pain, oral and throat cancer, oral sores, birth defects such as cleft lip and palate, periodontal (gum) disease, tooth decay and tooth loss, and other diseases and disorders that affect the oral cavity (WHO Fact Sheet No 318, 2012).

Oral Health Status

Table 3.12.1 shows the percentage of respondents in regards to number of natural teeth present. Overall, eighty nine percent of all the respondents have 28 or more natural teeth. The age group 60-69 has the lowest percentage with more than 28 natural teeth at 60 percent.

Ninety two percent of the urban residents have 28 or more teeth compared with eighty seven percent in rural. Respondents from the richest wealth quintile have the highest percentage of 28 teeth or more (Appendix Table B25).

Perception of state of teeth

Table 3.12.2 indicates the percentage of respondents' who perceive their state of teeth to be poor or very poor among those having natural teeth. Only 12 percent of the respondents reported to have poor or very poor state of teeth. Women reported a higher percentage of having poor or very poor state of teeth at 15 percent compared to men at 8 percent. For both sexes, age 60-69 years reported the highest percentage (24 percent) of poor or very poor state of the teeth.

Table 3.12.2: Percentage of respondents having poor or very poor state of teeth among those having natural teeth

Oral health behavior/risk factors

Dental visits

Table 3.12.8 shows percentage of respondents who have visited a dentist within the past 12 months. Approximately, 11 percent of the respondents have visited a dentist in the last 12 months. Women (13 percent) are likely to have visited the dentist more than men (8 percent). Among men, the highest percentage of those who have seen a dentist in the last 12 months are the age group 18-29 at 9 percent while among the women the age 30-44 are highest at 15 percent.

Age Group (years)	Men			Women			Both Sexes		
	n	% having visited a dentist during the past 12 months	95% CI	n	% having visited a dentist during the past 12 months	95% CI	N	% having visited a dentist during the past 12 months	95% CI
18-29	559	8.8	5.6-12.0	936	13.1	8.9-17.4	1495	11.0	7.8-14.3

Table 3.12.9 shows the distribution of respondents who have visited a dentist in the past 12 months by residence and wealth quintile. Respondents in the richest quintile are more likely to have visited a dentist than respondents in the poorest quintile at (12 percent vs 7 percent). The survey results reveal that that higher the education level, the more the likelihood to have visited a dentist

Perception of state of teeth

Table 3.12.2 indicates the percentage of respondents' who perceive their state of teeth to be poor or very poor among those having natural teeth. Only 12 percent of the respondents reported to have poor or very poor state of teeth. Women reported a higher percentage of having poor or very poor state of teeth at 15 percent compared to men at 8 percent. For both sexes, age 60-69 years reported the highest percentage (24 percent) of poor or very poor state of the teeth.

CHAPTER FOUR

DISCUSSION AND CONCLUSIONS

CHAPTER FOUR: DISCUSSION AND CONCLUSIONS

The STEPwise survey for NCD risk factors is the first nationwide household survey that is able to furnish the country with information regarding the four main NCD risk factors, violence and injury and oral health.

Tobacco Use

This survey showed that 13 percent of Kenyan adults aged between 18 to 69 years currently consume any tobacco products. The country has previously conducted the Global Adult Tobacco Survey (GATS) nationally in 2014 therefore some comparisons of findings is possible. STEPs reported an overall prevalence of tobacco use of 13 percent which is comparable to the 12 percent found in GATS. This slight difference can be attributed to the different sample population ages that were used. The respondents in GATS were age 15 and above while in STEPs respondents were age 18-69 years. It should be noted that in between the two surveys a national media campaign was conducted which had the overall aim of educating on the harmfulness of tobacco use, encouraging people to quit tobacco use and discourage initiation into tobacco use. Prevalence of tobacco smoking is 10 percent in this survey. Smokeless tobacco consumption in the country is 5 percent indicating that targeted initiatives should be developed to reduce smokeless tobacco consumption.

Approximately 24 percent and 21 percent of Kenyans reported to be exposed to second hand smoking (SHS) at home and work respectively. The Tobacco Control Act 2007 prohibits tobacco smoking in public in a bid to reduce the effects of SHS which has been documented to be responsible for 600,000 deaths globally (World Health Organization, 2011). The country is in the right direction in tobacco control and needs to sustain and step up tobacco control efforts and in particular ensure tobacco control initiatives are implemented throughout the country.

Alcohol Use

The harmful use of alcohol is among the five top risk factors for diseases and is associated with over 200 diseases and conditions. (World Health Organisation, 2014). Sixty two percent of the respondents are lifetime abstainers. This is an encouraging finding but nevertheless efforts need to be put in place to ensure that the country has a higher number of abstainers by specifically addressing the youth. The proportion of lifetime abstainers among women is twice than among men. Among respondents who have ever drunk alcohol only thirteen percent have abstained in the past 12 months.

Nearly a fifth of all the respondents are current alcohol drinkers defined as having drunk alcohol within the past 30 days with thirteen percent of these consuming alcohol daily. This is a considerable high percentage when taking into account that there are not only health consequences but alcohol use also has social and economic consequences.

Nearly 13 percent of Kenyans are involved in a heavy episodic drinking occasion in the past 30 days. Heavy episodic drinking is described as drinking more than six standard drinks in one occasion and is responsible for many acute consequences of drinking such as alcohol poisoning, injury and violence. The public needs to be informed of the determinants of alcohol related harm and be discouraged on alcohol consumption altogether.

Thirty six percent of the respondents had consumed unrecorded alcohol which includes homebrewed alcohol (excluding changaa, busaa or muratina) or any alcohol not intended for drinking in the past twelve months. This alcohol is not subjected to any formal government regulatory mechanism and may be associated with worse health outcomes.

Diet

The World Health Organization (WHO) recommends consumption of at least 5 portions of fruits and vegetables per day. Of concern is that 95 percent of the respondents reported that they consume less than 5 servings of fruit and/or vegetables on average per day. The mean number of days fruits are consumed is equally low at 2.5 days and slightly higher for vegetables at 5 days per week. It is acknowledged that the determinants of diet are multifactorial but however lack of awareness is a factor that contributes to people not consuming the inappropriate diet.

The surveys found that nearly a quarter of the respondents always or often add salt or salty sauce to their food before eating or as they are eating. High salt intake predisposes one to high blood pressure which is a risk factor for heart disease and stroke. (Organisation World Health, 2012). However a low proportion of Kenyans who always or often eat processed foods high in salt at 4 percent.

Consuming foods high in sugars leads to excess calories which can in turn lead to overweight and obesity. Despite 84 percent of the respondents always or often add sugar when cooking or preparing beverages at home, only 2 percent of Kenyans thinking they consume too much sugar. Twenty eight percent of Kenyans always add sugar to beverages with the highest percentage being among the poorest quintile.

Majority of the Kenyans (60 percent) reported that they use vegetable oil for most of their cooking. Despite this being a positive finding, it should be interpreted with caution due to the fact that some of the vegetable oil available in the country is not of the recommended standard. There may be issues of misrepresentation since this was self reporting and did not require verification.

Physical Inactivity

Physical activity has several health benefits and has the overall effect of reducing non communicable diseases and it is therefore important that strategies are put in place that will enable the community to be involved in regular physical activity. Seven percent of Kenyans are engaging in physical activity of less than 150 minutes of moderate-intensity activity per week, as recommended by WHO. The proportion of physical inactivity in rural and urban residence is 5 percent and 9 percent respectively. This is much lower than the global

prevalence of physical inactivity that stands at approximately 25 percent. The median time spent on physical activity per day is 263 minutes. The findings of this survey however may be biased as respondents' perception of vigorous and moderate physical activity which were subjective and therefore more efficient standardized tool to measure the level of physical activity in the community should be used.

Sedentary behavior is an important risk factor for all cause mortality independent of time spent on physical activity. The mean minutes spent on sedentary behavior is 150 minutes per day which is approximately 10 percent of the total time in one day. The recommended maximum sedentary time is 120 minutes. Although advances in technology are one of the factors that are contributing towards sedentary lifestyle, wellness policies should be instituted to reduce sedentary time.

Past Medical History

Screening and early detection is an important strategy for NCD prevention and control as early treatment prevents complication and improves treatment outcomes. A large proportion of Kenyans reported that they have never had their blood pressure, blood glucose and cholesterol measured by a health worker thereby predisposing them to late diagnosis and poor treatment outcomes. This can largely be attributed to the orientation of the health sector which is disease based and not focused on wellness as well as the health seeking behavior of the population.

Fifty six percent of Kenyans have never had their blood pressure measured by a health worker. Of those who reported ever having their blood pressure measured, 9 percent had been informed that they had an elevated blood pressure or hypertension. Among those who had been informed that they had an elevated blood pressure or hypertension only 22 percent reported that they were on medication prescribed by a health worker within the past two weeks. This depicts a substantially huge treatment gap which is alarming. Uncontrolled hypertension is an important risk factor for cardiovascular diseases.

Twelve percent of Kenyans reported to have ever had their blood sugar measured by a health worker out of which less than 2 percent had been informed that they had raised blood sugar or diabetes. As was noted with respondents who had ever been informed that they had an elevated blood pressure, only 40% of Kenyans who had been informed that they had raised blood sugar were taking drugs (medication) prescribed by other health worker.

Nearly all (98 percent) of the Kenyans had never been screened for cholesterol levels. This is not entirely surprising given that lack of availability and high costs of cholesterol test especially at primary health facilities. It follows that less than 1 percent had informed told by a health worker that they have raised cholesterol with elevated blood cholesterol and among this group only 13 percent were currently on medication.

Cervical Cancer Screening

Cervical cancer is the second leading cause of mortality among cancers in women in the country (National Cancer Control Strategy, 2012). More than 80 percent of the cancer diagnosis in Kenya is made at an advanced stages where treatment options are very limited and outcome is poor this has largely been attributed to low awareness, poor referral structures and inadequate screening and diagnostic facilities.(Division of Reproductive Health, 2015). Only 43 percent of Kenyans are aware of any of the three cervical cancer screening methods namely VILI, VIA HPV test and Pap smear.

The uptake of cervical screening among Kenyans age 18- 69 years is 11 percent for age while among age group 30-49 where cervical cancer screening is recommended is 16 percent. This is an increase from previous studies that have found the coverage of screening among women aged 18-69 to be 3.2 percent (Division of Reproductive Health, 2015). This could be explained by the fact that only 47 percent of the women are aware of the cervical cancer screening methods. The intensification of initiatives by both government and nongovernmental players to increase screening uptake may have resulted in the increase in coverage between 2012 and the present but nevertheless the coverage of 11 percent is unacceptably low.

Obesity and overweight are associated with cardiovascular disease, diabetes, cancer (e.g endometrial, breast and colon) and musculoskeletal diseases .The survey found that 28 percent of the Kenyans are overweight and obese with a significant difference in proportion between the men (18 percent) and women (39 percent). These findings are almost similar to KDHS 2014 findings that reported a prevalence of overweight and obesity of 33 percent among women of age group 15- 49 years, portending a significant risk of developing NCDs and their complications.

The prevalence of hypertension was found to be 24 percent. Among this group, 92 percent are not currently on medication. This is an alarming finding given the complications of uncontrolled raised blood pressure on heart and blood vessels that results to multiple end organ damage.

Biochemical Measurements

Three percent of Kenyans have impaired fasting glycemia while 2 percent of the respondents have diabetes. This is almost similar to estimates from the International Diabetes federation which has reported a prevalence of 2.2 percent for diabetes in the country (IDF Atlas, 2015). There is need to improve the health care infrastructure for diabetes prevention and control as this is an emerging problem.

Cardiovascular risk

Factoring in age, sex, blood pressure, smoking total cholesterol, and diabetes, eight percent of the Kenyans age 40-69 years have a CVD risk of 30 percent or above and thus at high risk of developing cardiovascular disease or dying from a CVD event within the next 10 years. This model however does not include obesity, physical inactivity, low socioeconomic status and a family history of premature cardiovascular disease which can all modify cardiovascular risk. The findings may therefore be an underestimation of the actual risk.

Combined Risk factors

The STEPs survey found that 14 percent of the Kenyans have three or more risk factors amongst daily cigarette smoking, less than five servings of fruits and vegetables, overweight, raised BP which raises concerns about future trends in the burden of NCD. This is especially alarming in the age group 45-69 years considering that 26 percent have three or more of the above risk factors

Violence and Injury

The Kenya traffic Amendment Act Cap 403 mandates that every driver and passenger should always wear a seat belt when inside a vehicle. Eighty eight percent of Kenya do not always wear seat belts. The enforcement of this specific law has in the recent times been said to be weak and may contribute to the low rate of compliance (Manyara, 2013). This has been compounded further by lack of functional seat belts in especially public service vehicles. With regards to helmet use, the survey results show that 94 percent of Kenyans do not always wear a helmet. The hygiene standards of helmets are also wanting hence shunned by mostly passenger. Enforcement in these areas is also weak and challenging. Despite heightened campaigns by the National Transport and Safety Authority (NTSA) to ensure drink driving is eliminated on the roads 3 percent of respondents reported that they had driven when drunk but because this was self reported a misrepresentation bias is possible.

Road traffic injuries (RTI) account for approximately a third of all the injury fatalities (Saidi H, 2013). Six percent of respondents reported that they had been involved in a road traffic crash in the past one year of which 54 percent were serious enough to warrant medical attention. One in ten respondents has been involved in a serious injury other than RTI with the leading cause of injury being cuts followed by burns. Four in ten of the non RTI injuries occurred at home. It should be noted that majority of these injuries are preventable by adopting safe practices.

Matters pertaining to violence have a societal causal mechanism including economic status, culture and religion. Four percent of the respondents have been seriously injured in a violent incident. Despite this, there have been effective programs implemented elsewhere that can reduce prevalence of violence. It should be noted that only 21 percent of the violent acts were committed by strangers therefore initiatives that promote cohesion in the community should be promoted.

Oral Health

The oral health section of the STEPs survey sought to determine perception and practice of respondents towards oral health. A fairly low number of respondents (12 percent) reported that they had poor or very poor state of teeth. This could be an indication that respondents may be knowledgeable on how to take care of their teeth hence suffering from minimal dental problems. In a recent national oral survey 18 percent of Kenyans perceived that their teeth were in poor or very poor status. (MOH, Kenya National Oral Health Survey Report, 2015).

Nearly a third of the Kenyans had experienced oral pain and discomfort in the past twelve months with a further 12 percent had experienced difficulty in doing usual activities in the same period. Only, 11 percent had visited a dentist in the past 12 months and although this may not necessarily be the ones who had experienced pain and discomfort, these findings show that utilization of dental service remains low in the country. This is further supported by the fact that 63 percent of Kenyans have never visited a dentist. This is much higher than the results of the national oral survey 2015 that found that 28 percent of Kenyans have never visited a dentist.

Self reporting daily cleaning of teeth at least once was high at 89 percent. This is comparable to the 79 percent reported in the national oral survey. Majority of the respondents (76 percent and 72 percent) use toothbrush and fluoride tooth paste to clean their teeth respectively. This is close to figures found in the oral survey of 72 percent and 77 percent for tooth brush and tooth paste use respectively.

Healthy lifestyle advice by Health Workers

Health workers play a major role in the prevention of non-communicable diseases by educating their clients on the need to adopt healthy lifestyles. Kenyans were asked if they had been advised by a health worker to either avoid engaging in a certain risky behavior or encouraged to adopt healthy habits that reduce their risk of developing NCDs. It is worrying to note that only 8 percent and 10 percent of Kenyans have been advised to quit or not to start tobacco use and alcohol drinking respectively. Further 10 percent of Kenyans have been advised to limit consumption of both salt and fats in the diet. Ten percent of Kenyans reported that they have been advised to eat adequate fruits and vegetables

CHAPTER FIVE

POLICY IMPLICATIONS AND RECOMMENDATIONS

CHAPTER FIVE: POLICY IMPLICATIONS AND RECOMMENDATIONS

The Kenya STEPs is the first nationally representative survey to collect comprehensive information on risk factors for NCDs, Injuries and oral health in Kenya. It provides essential information on Key NCD indicators by age group, sex and residence, education level and wealth quintile in some cases. The findings are useful in informing public health policy and the following recommendations are proposed:

1. There is a need to Prioritize NCD prevention and control at both national and county level using whole of government, whole of society and life course approach as it is an emerging threat to health, social and economic development.
2. Sustained public awareness campaigns and interventions to reduce the modifiable risk factors for NCDs: unhealthy diets, physical inactivity, harmful use of alcohol, tobacco use and exposure to tobacco smoke.
3. Build the capacity of the health workforce while ensuring the availability, access, affordability and quality of safe, efficacious medicines and basic technologies for screening, diagnosis, treatment and monitoring of common NCDs such as hypertension and diabetes at primary health care.
4. Restructure the health information systems to guarantee reliable, timely, complete and quality data for evidence-based practice and decision making in NCD prevention and control.
5. Establish wellness clinics in all facilities to encourage early detection and screening of NCDs such as diabetes, cervical cancer, hypertension and others as well as serve as sources of information for prevention and health promotion.
6. Strengthen the implementation of the Framework Convention on Tobacco Control (FCTC) by enforcing the provisions of the Tobacco control Act at both the national and county level.
7. Adapt the global strategy to reduce harmful use of alcohol.
8. Strengthen implementation of the Kenya's National Nutrition Action Plan 2012-2017 and ensure continuous engagement with the agricultural sector to promote healthy diets and eating habits.
9. Introduction of legislations on production, packaging and responsible marketing of food and drinks to reduce consumption of unhealthy foods.
10. Implement the physical activity tool kit in the country to encourage adoption of active lifestyles and to reduce sedentary lifestyles.
11. Establish mechanisms to foster multi-sectoral collaboration to ensure all the pillars of the decade of action on road safety are well implemented

12. Conduct public education and social marketing campaigns on prevention of injuries.
13. Strengthen the delivery of oral health services throughout the country by raising the awareness on the importance of regular dental checkups and maintenance of proper oral health hygiene.
14. Integrate NCD indicators in national health surveys to supplement the data collected in periodic STEPS survey for proper planning and projection of NCD prevention and control.

APPENDIX

APPENDIX A - SAMPLE DESIGN FOR THE 2015 STEPS SURVEY

I. INTRODUCTION

The 2015 Kenya STEPs Survey is part of international WHO STEPwise approach to surveillance of chronic disease risk factors. The survey design followed the recommendations and adjusted into the Kenyan situation.

II. STUDY POPULATION

- a) The recommendation for STEPs was to draw sample population from the targeted population by use of age-sex groups. The age groups used intervals of 12 years of individuals aged 18 years to 69 years
- b) The population covered by the 2015 Kenya STEPS survey was defined as the universe of non-institutionalized population of men and women age 18 - 69 years
- c) A sample of households were selected and one person identified within the age groups of interest in the households was eligible for interview and measurements.
- d) The inclusion criteria was:
 - i. Individuals aged between 18 and 69 years
 - ii. Willing and able to provide informed consent for participation
- e) The exclusion criteria was:
 - i. Individuals not aged between 18 and 64 69 years
 - ii. Unable or unwilling to provide informed consent or assent.

III. SAMPLE FRAME

Administratively, Kenya is divided into 47 Counties. In turn, each county is subdivided into Sub-Counties. Prior to the enactment of the current constitution in 2010, the sub-counties had not been created but are similar units were the districts. Each district was divided into divisions, each division into locations and each location into sub-locations. In addition to these administrative units, prior to the 2009 population census, each sub-location was subdivided into census enumeration areas (EAs) i.e. small geographic units with clearly defined boundaries. A total of 96,251 EAs were developed. The list of EAs is grouped by administrative units and includes information on the number of households and population. This information was used in 2010 to design a master sample known as the fifth National Sample Survey and Evaluation Programme (NASSEP V) with a total of 5,360 selected EAs.

The NASSEP V master frame follows a two-stage stratified cluster sample format. The first stage involved selection of Primary Sampling Units (PSUs) which were the EAs using probability proportional to size (PPS) method, with the measure of size being the households from 2009 census. The second stage involves the selection of households for various surveys. The frame was designed in a multi-tiered structure with four sub-samples (C1, C2, C3 and C4), each consisting of 1,340 EAs that can serve as independent frames

The NASSEP V frame used the counties as the first level stratification and further sub divided into rural and urban sub domains. The sampling was done independently within rural - urban sub domains. Each sampled EA was developed into a cluster and undergone listing and mapping process and clusters are within measure of size of average of 100 households (between 50 households and 149 households).

IV. SAMPLE SIZE AND ALLOCATION

Following the recommendations detailed in STEPS manual, the survey drew sample population from the targeted population by use of age-sex groups. The age groups used intervals of 12 years of population age 18 years to 69 years, resulting into eight groups.

The sample size was calculated using the formula;

$$n = \frac{Z^2 P(1-P)}{e^2}$$

Where
 n= sample size,
 Z= level of confidence,
 P= baseline level of the selected indicator
 e= margin of error

Using the values, P= 0.50, Z= 1.96 (95 percent confidence Interval), P =50 percent (as recommended by WHO for countries who have not conducted a STEPS survey before) and e= 0.05, the initial estimated sample size was 384. Further adjustments that included multiplication of the sample by 1.5 (design effect to cater for complex survey), 8 (the number of 12 year age-sex groups and 1.25 (to cater for 20 percent non-response) yielded a sample of 5,760. The sample was further adjusted to ease allocation into various strata.

The sample was allocated into all the 92 strata in the NASSEP V frame, ensuring that a minimum of two clusters were selected per strata. This was achieved using power allocation method.

The sample size for 2015 Kenya STEPS survey was 6,000 individuals selected from a total of 200 clusters (100 in urban and 100 in rural) with a uniform sample of 30 individuals per cluster. Distribution of the sample by county and residence is shown in Table 1.

V. SAMPLE SELECTION

The 2015 Kenya STEPS survey sample was selected in three stages. Stage one involved selection of PSUs (i.e. clusters), households and individuals.

Selection of PSUs

The selection of clusters was done using the Equal Probability Selection Method (EPSEM). The clusters were selected systematically from NASSEP V frame with equal probability independently within the urban-rural domains. The process involved ordering the clusters by county, then by urban/rural, and finally by unique geocode. The resulting sample retained properties of PPS as used in creation of the frame.

Household selection

Using the total number of households from each sampled cluster available from the NASSEP V, a uniform sample of 30 households per cluster was selected using systematic sampling method. This procedure of selecting the sample households with a random start was done by the following criteria:

Let L be the total number of households listed in the cluster;
 Let Random be a random number between $(0, 1)$;
 Let n be the number of households selected in the cluster;
 Let $l = L/n$ be the sampling interval.

- (1) The first selected sample household is k (k is the serial number of the household in the listing) if and only if:
 $(k-1)/L < \text{Random} \leq k/L$
- (2) The subsequent selected households are those having serial numbers:
 $k + (j-1)*l$, (rounded to integers)
 for $j = 2, 3, \dots n$;

Random numbers were different and independent from cluster to cluster.

Individual selection

All the selected clusters and corresponding households were loaded into Personal Digital Assistants (PDAs). During interviews, all the eligible household members were listed down and PDA used to randomly select one for interviews using the inbuilt Kish Grid method.

County		Sample Size

First Name	<input type="text"/>	I9
Contact phone number where possible (10 digits)	<input type="text"/>	I10

Step 1 Demographic Information		
Demographic Information		
Question	Response	Code
Sex (Record Male / Female as observed)	Male 1 Female 2	C1
What is your date of birth? Don't Know 77 77 7777	<div> <div> <div></div> <div></div> </div> <div> <div></div> <div></div> </div> <div> <div></div> <div></div> <div></div> <div></div> </div> </div> <div> <div>dd</div> <div>mm</div> <div>year</div> </div> <div>If known, Go to C4</div>	C2
How old are you?	Years <div> <div></div> <div></div> </div>	C3
In total, how many years have you spent at school and in full-time study (excluding pre-school)?	Years <div> <div></div> <div></div> </div>	C4
What is the highest level of education you have completed? [INSERT COUNTRY-SPECIFIC CATEGORIES]	No formal schooling 1 primary school incomplete 2 Primary school completed 3 Secondary school incomplete 4 Secondary school completed 5 A-level completed 6 College/University completed 7 Post graduate degree 8 Refused 88	C5
What is your <i>ethnic background</i> ?	Borana 1 Embu 2 Kalenjin 3 Kamba 4 Kikuyu 5 Kisii 6 Luhya 7 Luo 8 Maasai 9 Meru 10 Miji Kenda 11 Somali 12 Turkana 13 Others 14 Refused 88	C6
What is your marital status ?	Never married 1 Currently married 2 Separated 3 Divorced 4 Widowed 5 Cohabiting 6 Refused 88	C7

Question	Response	Code
Which of the following best describes your main work status over the past 12 months?	Government employee 1 Non-government employee 2 Self-employed 3 Non-paid/volunteer 4 Student 5 Homemaker (housewife/house husband) 6 Retired 7 Unemployed (able to work) 8 Unemployed (unable to work) 9 Refused 88	C8
How many people older than 18 years, including yourself, live in your household?	Number of people <input type="text"/>	C9
What is the main source of drinking water for members of your household? (Choose ONLY One)	Piped water (into dwelling) 11 Piped into compound, yard 12 Piped to neighbor 13 Piped to water kiosk 14 Public tap/standpipe 15 Tubewell/Borehole 21 Dug well (protected) 31 Dug well (unprotected) 32 Spring water (protected) 41 Spring water (unprotected) 42 Rainwater collection 51 Tanker-truck 61 Cart with small tank/drum 71 Surface water (river, stream, dam, lake, pond, canal, irrigation channel) 81 Bottled water 91 Other (<i>specify</i>) 96	X3
	Others	X3others

Question	Response	Code
What kind of toilet facility do members of your household usually use?	Flush to piped sewer system 11 Flush to septic tank 12 Flush to pit (latrine) 13 Flush to somewhere else 14 Flush to unknown place/not sure/DK 15 Ventilated Improved Pit latrine (VIP) 21 Pit latrine with slab 22 Pit latrine without slab/open 23 Composting toilet 31 Bucket 41 Hanging toilet/hanging 51 No facilities or bush or field or ocean 95 Other (specify) 96	X4
	Others _____	X4other
Main material of the dwelling floor: Record observation	Earth/sand 11 Dung 12 Wood planks 21 Palm/bamboo 22 Parquet or polished wood 31 Vinyl or asphalt strips 32 Ceramic tiles 33 Cement 34 Carpet 35 Other (specify) 96	X5
	Other _____	X5other s
Main material of the roof: Record observation (Choose ONLY One)	No Roof 11 Grass/Thatch/Makuti 12 Dung/Mud 13 Corrugated iron (Mabati) 21 Tin cans 22 Asbestos sheet 31 Concrete 32 Tiles 33 Others 96	X6
	Others _____	X6other s

Question	Response	Code
Main materials of the walls: Record observation	No walls 11	X7
	Cane/palm/trunks 12	
	Dirt 13	
	Bamboo with mud 21	
	Stone with mud 22	
	Uncovered adobe 23	
	Plywood 24

	Straw/shrubs/grass 09	
	Animal dung 10	
	Agricultural crop residue 11	
	Other (specify) 96	
	No food cooked in the 97	
Does this household or any member of ther household own any of the following items?	a. Electricity 1 = Yes, 2 = No	X9a
	b. Radio 1 = Yes, 2 = No	X9b
	c. Television 1 = Yes, 2 = No	X9c
	d. Mobile Telephone 1 = Yes, 2 = No	X9d
	e. Non-Mobile Telephone 1 = Yes, 2 = No	X9e
	f. Refrigerator 1 = Yes, 2 = No	X9f
	g. Washing machine 1 = Yes, 2 = No	X9g
	h. Computer 1 = Yes, 2 = No	X9h
	i. Watch 1 = Yes, 2 = No	X9i
	j. Bicycle 1 = Yes, 2 = No	X9j
	k. Motorcycle/scooter 1 = Yes, 2 = No	X9k
	l. Animal Drawn Cart 1 = Yes, 2 = No	X9l
	m. Car\Truck 1 = Yes, 2 = No	X9m
	n. Boat with motor 1 = Yes, 2 = No	X9n

Do you or someone living in this household own this dwelling or do you rent this dwelling?	Own 1 Rent 2 Rent free/squatter/other 3	X10
Does your household employ any help (such as house help, shamba man etc)?	Yes 1 No 2	X11
Does any member of this household own any agricultural land?	Yes 1 No 2	X12
Does this household own any livestock, herds, other farm animals, or poultry?	Yes 1 No 2 If no, skip to T1	X13
How many of the following animals does the household own?	a. Local Cattle b. Exotic/grade cattle c. Horse/donkey/camel d. goat e. sheep f. chicken/goose/duck g. Pigs h. Camel If don't know, record 888	X14a X14b X14c X14d X14e X14f X14g X14h

Step 1 Behavioural Measurements

CORE: Tobacco Use

Now I am going to ask you some questions about tobacco use.

Question	Response	Code
Do you currently smoke any tobacco products, such as cigarettes, hand-rolled, cigars, waterpipes/shisha, or pipes/kiko? (USE SHOWCARD)	Yes 1 No 2 If No, go to T8	T1
Do you currently smoke tobacco products daily ?	Yes 1 No 2	T2
How old were you when you first started smoking?	Age (years) Don't know 77 <input type="text"/> <input type="text"/> If Known, go to T5a/T5aw	T3
Do you remember how long ago it was? (RECORD ONLY 1, NOT ALL 3) Don't know 77	In Years <input type="text"/> <input type="text"/> If Known, go to T5a/T5aw OR in Months <input type="text"/> <input type="text"/> If Known, go to T5a/T5aw OR in Weeks <input type="text"/> <input type="text"/>	T4a T4b T4c
On average, how many of the following products do you smoke each day/week ? (IF LESS THAN DAILY, RECORD WEEKLY) (RECORD FOR EACH TYPE, USE SHOWCARD) Don't Know 7777	DAILY↓ WEEKLY↓	
	Manufactured cigarettes <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	T5a/T5aw
	Hand-rolled cigarettes <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	T5b/T5bw
	Pipes full of tobacco (Kiko) <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	T5c/T5cw
	Cigars, cheroots, cigarillos <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	T5d/T5dw
	Number of Shisha sessions <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	T5e/T5ew
	Other <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> If Other, go to T5other, else go to T6	T5f/T5fw
	Other (please specify): <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	T5other / T5otherw
During the past 12 months, have you tried to stop smoking ?	Yes 1 No 2	T6

Question	Response	Code
During any visit to a doctor or other health worker in the past 12 months, were you advised to quit smoking tobacco?	Yes 1 <i>If T2=Yes, go to T12; if T2=No, go to T9</i> No 2 <i>If T2=Yes, go to T12; if T2=No, go to T9</i> No visit during the past 12 months 3 <i>If T2=Yes, go to T12; if T2=No, go to T9</i>	T7
In the past, did you ever smoke any tobacco products? <i>(USE SHOWCARD)</i>	Yes 1 No 2 <i>If No, go to T12</i>	T8
In the past, did you ever smoke daily ?	Yes 1 <i>If T1=Yes, go to T12, else go to T10</i> No 2 <i>If T1=Yes, go to T12, else go</i>	T9
How old were you when you stopped smoking?	Age (years) <input type="text"/> <input type="text"/> <i>If Known, go to T12</i> Don't Know 77	T10
How long ago did you stop smoking? <i>(RECORD ONLY 1, NOT ALL 3)</i> <i>Don't Know 77</i>	Years ago <input type="text"/> <input type="text"/> <i>If Known, go to T12</i>	T11a
	OR Months ago <input type="text"/> <input type="text"/> <i>If Known, go to T12</i>	T11b
	OR Weeks ago <input type="text"/> <input type="text"/>	T11c
Do you currently use any smokeless tobacco products such as <i>snuff, chewing tobacco, kuber, , pan?</i> <i>(USE SHOWCARD)</i>	Yes 1 No 2 <i>If No, go to T15</i>	T12
Do you currently use smokeless tobacco products daily ?	Yes 1 No 2 <i>If No, go to T14aw</i>	T13
On average, how many times a day/week do you use <i>(IF LESS THAN DAILY, RECORD WEEKLY)</i> <i>(RECORD FOR EACH TYPE, USE SHOWCARD)</i> <i>Don't Know 7777</i>	DAILY↓ WEEKLY↓	
	Snuff, by mouth <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	T14a/ T14aw
	Snuff, by nose <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	T14b/ T14bw
	Chewing tobacco e.g. kuber <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	T14c/ T14cw
	Betel, quid with tobacco (pan) <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/>	T14d/ T14dw
	Other <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <i>If Other, go to T14other, if T13=No, go to T16, else go to T17</i>	T14e/ T14ew
	Other (please specify): <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <input type="text"/> <i>If T13=No, go to T16, else go to T17</i>	T14other/ T14otherw
In the past , did you ever use smokeless tobacco products such as <i>snuff, chewing tobacco, kuber, or pan?</i>	Yes 1 No 2 <i>If No, go to T17</i>	T15

Question	Response	Code
In the past , did you ever use smokeless tobacco products such as <i>snuff, chewing tobacco, or betel</i> daily ?	Yes 1 No 2	T16
During the past 30 days, did someone smoke in your home ?	Yes 1 No 2	T17
During the past 30 days, did someone smoke in closed areas in your workplace (in the building, in a work area or a specific office)?	Yes 1 No 2 Don't work in a closed 3	T18
Have you ever used an electronic cigarette?"	Yes 1 No 2 Don't know 3	X15

Alcohol Consumption

The next questions ask about the consumption of alcohol. When asking about amount of alcohol consumed, you can tell me what types of alcohol you were drinking and I will calculate how much this is when measured in "standard unit of alcohol" or "standard drink" which is the amount of alcohol you find in a small beer, one glass of wine, or one tot of spirits.

Question	Response	Code
Have you ever consumed any alcohol such as beer, wine, spirits, fermented cider, changaa, busaa, or any other local brew? (USE SHOWCARD OR SHOW EXAMPLES)	Yes 1 No 2 <i>If No, go to D1</i>	A1
Have you consumed any alcohol within the past 12 months ?	Yes 1 <i>If Yes, go to A4</i> No 2	A2
Have you stopped drinking due to health reasons, such as a negative impact on your health or on the advice of your doctor or other health worker?	Yes 1 <i>If Yes, go to D1</i> No 2 <i>If No, go to D1</i>	A3

Question	Response	Code
During the past 12 months, how frequently have you had at least one standard alcoholic drink? (<i>READ RESPONSES, USE SHOWCARD</i>)	Daily 1 5-6 days per week 2 3-4 days per week 3 1-2 days per week 4 1-3 days per month 5 Less than once a month 6	A4
Have you consumed any alcohol within the past 30 days ?	Yes 1 No 2 <i>If No, go to D1</i>	A5
During the past 30 days, on how many occasions did you have at least one standard alcoholic drink?	Number Don't know 77 <input type="text"/>	A6
During the past 30 days, when you drank alcohol, how much did you on average drink during one drinking occasion? (<i>USE SHOWCARD</i>)	Number of standard units of alcohol Don't know 77 <input type="text"/>	A7
During the past 30 days, what was the largest number of standard drinks you had on a single occasion, counting all types of alcoholic drinks together?	Largest number of standard units of alcohol Don't Know 77 <input type="text"/>	A8
During the past 30 days, how many times did you have six or more standard drinks in a single drinking occasion?	Number of times Don't Know 77 <input type="text"/>	A9
During each of the past 7 days , how many standard drinks did you have each day? (<i>USE SHOWCARD</i>) <i>Don't Know 7</i>	Monday <input type="text"/>	A10a
	Tuesday <input type="text"/>	A10b
	Wednesday <input type="text"/>	A10c
	Thursday <input type="text"/>	A10d
	Friday <input type="text"/>	A10e
	Saturday <input type="text"/>	A10f
	Sunday <input type="text"/>	A10g

Alcohol Consumption, continued

I have just asked you about your consumption of alcohol during the past 7 days. The questions were about alcohol in general, while the next questions refer to your consumption of homebrewed alcohol, alcohol brought over the border/from another country, any alcohol not intended for drinking or other untaxed alcohol. Please only think

Question	Response	Code
During the past 7 days , did you consume any homebrewed alcohol (excluding changaa, busaa or muratina) or any alcohol not intended for drinking ? (USE SHOWCARD)	Yes 1 No 2 <i>If No, go to D1</i>	A11
On average, how many standard drinks of the following did you consume during the past 7 days ? (USE SHOWCARD) <i>Don't Know 77</i>	Homebrewed spirits, e.g. changaa <input type="text"/>	A12a
	Homebrewed beer or wine, e.g. Busaa, muratina, mnazi, mkoma beer, or fruit wine <input type="text"/>	A12b
	Alcohol brought over the border/from another country <input type="text"/>	A12c
	Alcohol not intended for drinking, e.g. alcohol-based medicines, perfumes, after shaves <input type="text"/>	A12d
	Other untaxed alcohol in the country <input type="text"/>	A12e

Diet

The next questions ask about the fruits and vegetables that you usually eat. I have a nutrition card here that shows you some examples of local fruits and vegetables. Each picture represents the size of a serving (one serving). As you answer these questions please think of a typical week in the last year.

Question	Response	Code
In a typical week, on how many days do you eat fruit ? (USE SHOWCARD)	Number of days <input type="text"/> Don't Know 77 <input type="text"/> <i>If Zero days, go to D3</i>	D1
How many servings of fruit do you eat on one of those days? (USE SHOWCARD)	Number of servings <input type="text"/> Don't Know 77 <input type="text"/>	D2
In a typical week, on how many days do you eat vegetables ? (USE SHOWCARD)	Number of days <input type="text"/> Don't Know 77 <input type="text"/> <i>If Zero days, go to D5</i>	D3
How many servings of vegetables do you eat on one of those days? (USE SHOWCARD)	Number of servings <input type="text"/> Don't know 77 <input type="text"/>	D4

Dietary

With the next questions, we would like to learn more about salt in your diet. Dietary salt includes ordinary table salt, unrefined salt such as sea salt, iodized salt, salty stock cubes and powders, and salty sauces such as soya sauce or fish sauce (see show cards). The following questions are on adding salt to the food right before you eat it, on how food is prepared in your home, on eating processed foods that are high in salt such as packaged salty snacks e.g crisps, and questions on controlling your salt intake. Please answer the questions even if you consider yourself to eat a diet low in salt.

Question	Response	Code
How often do you add salt or a salty sauce such as soya sauce to your food right before you eat it or as you are eating it? (USE SHOWCARD)	Always (every meal) 1 Often (most meals) 2 Sometimes (every week) 3 Rarely (not every week) 4 Never 5 Don't know 77	D5
How often is salt, salty seasoning or a salty sauce put in the food when cooking or preparing foods in your household?	Always (every meal) 1 Often (most meals) 2 Sometimes (every week) 3 Rarely (not every week) 4 Never 5 Don't know 77	D6
How often do you eat processed food high in salt ? By processed food high in salt, I mean foods that have been altered from their natural state, such as njugu-karanga, packaged salty snacks, canned salty food including pickles and preserves, salty food prepared at a fast food restaurant, cheese, bacon and processed meat (USE SHOWCARD)	Always (every meal) 1 Often (most meals) 2 Sometimes (every week) 3 Rarely (not every week) 4 Never 5 Don't know 77	D7
How much salt or salty sauce do you think you consume?	Far too much 1 Too much 2 Just the right amount 3 Too little 4 Far too little 5 Don't know 77	D8
How important to you is lowering the salt in your diet?	Very important 1 Somewhat important 2 Not at all important 3 Don't know 77	D9
Do you think that too much salt or salty sauce in your diet could cause a health problem ?	Yes 1 No 2 Don't know 77	D10
Do you do any of the following on a regular basis to control your salt intake ? (RECORD FOR EACH)		
Limit consumption of processed foods	Yes 1 No 2 Not applicable 3	D11a

Question	Response	Code
Buy low salt/sodium alternatives	Yes 1 No 2 Not applicable 3	D11c
Use spices other than salt when cooking	Yes 1 No 2 Not applicable 3	D11d
Avoid eating foods prepared outside of a home	Yes 1 No 2 Not applicable 3	D11e
Do other things specifically to control your salt intake	Yes 1 <i>If Yes, go to</i> No 2 Not applicable 3	D11f
Other (please specify)	<input type="text"/>	D11other
The next questions ask about the oil or fat that is most often used for meal preparation in your household, and about meals that you eat outside a home.		
What type of oil or fat is most often used for meal preparation in your household? (USE SHOWCARD) (SELECT ONLY ONE)	Vegetable oil (liquid)	1
	Vegetable fat (solid)	2
	Lard or suet	3
	Butter or ghee	4
	Margarine	5
	Palm Oil	6
	Coconut Oil	7
	Other	8 <i>If Other, go to D12 other</i>
	None in particular	9
	None used	10
	Don't know	77
Other	<input type="text"/>	D12other
On average, how many meals per week do you eat that were not prepared at a home? By meal, I mean breakfast, lunch and dinner.	Number Don't know 77 <input type="text"/>	D13

Dietary Sugar Intake

With the next questions, we would like to learn more about sugar in your diet. Dietary sugar includes ordinary sugar, refined sugar such as candy, chocolate, fizzy drinks (see show card). The following questions are on adding sugar to beverages right before you drink them, on how sweet beverages foods are prepared in your home, on eating processed foods that are high in sugar such as packaged snacks and questions on controlling your sugar intake. Please answer the questions even if you consider yourself to eat a diet low in sugar.

Question	Response	Code
How often do you add sugar to your beverages right before you drink them or as you are drinking them? (SELECT ONLY ONE) (USE SHOWCARD)	Always (every drink) 1 Often (every day but not every day) 2 Sometimes (every week) 3 Rarely (not every week) 4 Never 5 Don't know 77	X16
In a typical week on how many days do you take soda (carbonated drinks) like fanta, coca cola, 7-up, Afya, Softa, Vimto, or other sugary drinks?	Number of days <input type="text"/> <input type="text"/> If Zero days, go to x18 Don't Know 77	X17a
How many 300ml bottles do you take each time you drink soda on one of those days? (USE SHOWCARD)	Number of servings <input type="text"/> <input type="text"/> Don't Know 77	X17b
Question	Response	Code
How often do you eat processed food high in sugar ? By processed food high in sugar, I mean biscuits, wafers, cakes, candy, sweets and chocolate and alike? (USE SHOWCARD)	Always (every meal) 1 Often (every day) 2 Sometimes (every week) 3 Rarely 4 Never 5 Don't know 77	X18
How much sugar do you think you consume?	Far too much 1 Too much 2 Just the right amount 3 Too little 4 Far too little 5 Don't know 77	X19
How important to you is lowering the sugar in your diet?	Very important 1 Somewhat important 2 Not at all important 3 Don't know 77	X20
Do you think that too much sugar in your diet could cause a health problem ?	Yes 1 No 2 Don't know 77	X21
Do you do any of the following on a regular basis to control your sugar intake ? (RECORD FOR EACH)		
Minimize the amount of sugar used in beverages	Yes 1 No 2	X22a
Limit consumption of soda and sugary drinks	Yes 1 No 2	X22b
Limit consumption of processed foods	Yes 1 No 2	X22c
Use of natural/unrefined alternatives	Yes 1 No 2	X22d
Do other things specifically to control your sugar intake	Yes 1 No 2	X22e
Other (please specify)	<input type="text"/>	X22other

Physical Activity

Next I am going to ask you about the time you spend doing different types of physical activity in a typical week. Please answer these questions even if you do not consider yourself to be a physically active person. Think first about the time you spend doing work. Think of work as the things that you have to do such as paid or unpaid work, study/training, household chores, harvesting food/crops, fishing or hunting for food, seeking employment. *[Insert other examples if needed]*. In answering the following questions 'vigorous-intensity activities' are activities that require hard physical effort and cause large increases in breathing or heart rate, 'moderate-intensity activities' are activities that require moderate physical effort and cause small increases in breathing or heart rate.

Work

Question	Response	Code	Question
Does your work involve vigorous-intensity activity that causes large increases in breathing or heart rate like <i>carrying or lifting heavy loads, digging or construction work</i> for at least 10 minutes continuously?	Yes 1 No 2 <i>If No, go to P 4</i>		P1
In a typical week, on how many days do you do vigorous-intensity activities as part of your work?	Number of days <input type="text"/>		P2
How much time do you spend doing vigorous-intensity activities at work on a typical day?	Hours : minutes <input type="text"/> : <input type="text"/> hrs mins		P3 (a-b)
Does your work involve moderate-intensity activity, that causes small increases in breathing or heart rate such as brisk walking <i>or carrying light loads</i> for at least 10 minutes continuously? <i>(USE SHOWCARD)</i>	Yes 1 No 2 <i>If No, go to P 7</i>		P4
In a typical week, on how many days do you do moderate-intensity activities as part of your work?	Number of days <input type="text"/>		P5
How much time do you spend doing moderate-intensity activities at work on a typical day?	Hours : minutes <input type="text"/> : <input type="text"/> hrs mins		P6 (a-b)

Travel to and from places		
Question	Response	Code
The next questions exclude the physical activities at work that you have already mentioned. Now I would like to ask you about the usual way you travel to and from places. For example to work, for shopping, to market, to place of worship.		
Do you walk or use a bicycle (<i>pedal cycle</i>) for at least 10 minutes continuously to get to and from places?	Yes 1 No 2 <i>If No, go to P 10</i>	P7
In a typical week, on how many days do you walk or bicycle for at least 10 minutes continuously to get to and from places?	Number of days <input type="text"/>	P8
How much time do you spend walking or bicycling for travel on a typical day?	Hours : minutes <input type="text"/> : <input type="text"/> hrs mins	P9 (a-b)
Recreational activities		
Question	Response	Code
The next questions exclude the work and transport activities that you have already mentioned. Now I would like to ask you about sports, fitness and recreational activities (leisure),		
Do you do any vigorous-intensity sports, fitness or recreational (<i>leisure</i>) activities that cause large increases in breathing or heart rate like running or playing football for at least 10 minutes continuously? (<i>USE SHOWCARD</i>)	Yes 1 No 2 <i>If No, go to P 13</i>	P10
In a typical week, on how many days do you do vigorous-intensity sports, fitness or recreational (<i>leisure</i>) activities?	Number of days <input type="text"/>	P11
How much time do you spend doing vigorous-intensity sports, fitness or recreational activities on a typical day?	Hours : minutes <input type="text"/> : <input type="text"/> hrs mins	P12 (a-b)
Do you do any moderate-intensity sports, fitness or recreational (<i>leisure</i>) activities that cause a small increase in breathing or heart rate such as brisk walking, <i>cycling, swimming, volleyball</i> for at least 10 minutes continuously? (<i>USE SHOWCARD</i>)	Yes 1 No 2 <i>If No, go to P16</i>	P13

Question	Response	Code
In a typical week, on how many days do you do moderate-intensity sports, fitness or recreational (<i>leisure</i>) activities?	Number of days <input type="text"/>	P14
How much time do you spend doing moderate-intensity sports, fitness or recreational (<i>leisure</i>) activities on a typical day?	Hours : minutes <input type="text"/> : <input type="text"/> hrs mins	P15 (a-b)

Sedentary behavior		
The following question is about sitting or reclining at work, at home, getting to and from places, or with friends including time spent sitting at a desk, sitting with friends, traveling in car, bus, train, reading, playing cards or watching television, but do not include time spent sleeping. (USE SHOWCARD)		
How much time do you usually spend sitting or reclining on a typical day?	Hours : minutes <input type="text"/> : <input type="text"/> hrs mins	P16 (a-b)

History of Raised Blood Pressure		
Question	Response	Code
Have you ever had your blood pressure measured by a doctor or other health worker?	Yes 1	H1
	No 2 <i>If No, go to H6</i>	
Have you ever been told by a doctor or other health worker that you have raised blood pressure or hypertension?	Yes 1	H2a
	No 2 <i>If No, go to H6</i>	
Have you been told in the past 12 months?	Yes 1	H2b
	No 2	
In the past two weeks, have you taken any drugs (medication) for raised blood pressure prescribed by a doctor or other health worker?	Yes 1	H3
	No 2	
Have you ever seen a traditional healer for raised blood pressure or hypertension?	Yes 1	H4
	No 2	
Are you currently taking any herbal or traditional remedy for your raised blood pressure?	Yes 1	H5
	No 2	

History of Diabetes		
Have you ever had your blood sugar measured by a doctor or other health worker?	Yes 1	H6
	No 2 <i>If No, go to H12</i>	
Have you ever been told by a doctor or other health worker that you have raised blood sugar or diabetes?	Yes 1	H7a
	No 2 <i>If No, go to H12</i>	
Have you been told in the past 12 months?	Yes 1	H7b
	No 2	
In the past two weeks, have you taken any drugs (medication) for diabetes prescribed by a doctor or other health worker?	Yes 1	H8
	No 2	
Are you currently taking insulin for diabetes prescribed by a doctor or other health worker?	Yes 1	H9
	No 2	
Have you ever seen a traditional healer for diabetes or raised blood sugar?	Yes 1	H10
	No 2	
Are you currently taking any herbal or traditional remedy for your diabetes?	Yes 1	H11
	No 2	

CORE: History of Cardiovascular Diseases		
Have you ever had a heart attack or chest pain from heart disease (angina) or a stroke (cerebrovascular accident or incident)?	Yes 1	H17
	No 2	
Are you currently taking aspirin regularly to prevent or treat heart disease?	Yes 1	H18
	No 2	
	Don't know 3	
Are you currently taking statins (Lovastatin/Simvastatin/Atorvastatin or any other statin) regularly to prevent or treat heart disease?	Yes 1	H19
	No 2	
	Don't know 3	

Lifestyle Advice		
During the past three years, has a doctor or other health worker advised you to do any of the following? (RECORD FOR EACH)		
Quit using tobacco or don't start	Yes 1	H20a
	No 2	
Reduce the use of alcohol/ don't start	Yes 1	H20b
	No 2	
Reduce salt in your diet	Yes 1	H20c
	No 2	
Reduce use of refined sugar in your diet	Yes 1	H20d
	No 2	
Eat at least five servings of fruit and/or vegetables each day	Yes 1	H20e
	No 2	
Reduce fat in your diet	Yes 1	H20f
	No 2	
Start or do more physical activity	Yes 1	H20g
	No 2	
Did not see a physician within the last 3 years		

Question	Response	Code
Maintain a healthy body weight or lose weight	Yes 1 No 2	H20h
Where is your primary source of health care?	Self-medication 1 Herbal/alternative therapy 2 Dispensaries 3 Community Health Worker 4 Health center 5 Sub county/district hospitals 6 County referral hospital (provincial) 7 National referral 8 Private clinic 9 Private hospital 10 OTC/pharmacy 11	X23

Cervical Cancer Screening

The next question asks about cervical cancer prevention. Screening tests for cervical cancer prevention can be done in different ways, including Visual Inspection with Acetic Acid/vinegar (VIA), pap smear and Human Papillomavirus (HPV) test. VIA is an inspection of the surface of the uterine cervix after acetic acid (or vinegar) has been applied to it. For both pap smear and HPV test, a doctor or nurse uses a swab to wipe from inside your vagina/cervix, take a sample and send it to a laboratory. It is even possible that you were given the swab yourself and asked to swab the inside of your vagina. The laboratory checks for abnormal cell changes if a pap smear is done, and for the HP virus if an HPV test is done.

Question	Response	Code
For men and women: Have you heard of the cervical cancer screening methods described above??	Yes 1 No 2 Don't know 77	X24
For women only: Have you ever had a screening test for cervical cancer, using any of these methods described above?	Yes 1 No 2 Don't know 77	CX1

Injury		
The next questions ask about different experiences and behaviours that are related to road traffic injuries.		
Question	Response	Code
In the past 30 days, how often did you use a seat belt when you were the driver or passenger of a motor vehicle?	All of the time 1 Sometimes 2 Never 3 Have not been in a vehicle in past 30 days 4 No seat belt in the vehicle I usually am in 5 Don't Know 77 Refused 88	V1
In the past 30 days, how often did you wear a helmet when you drove or rode as a passenger on a motorcycle or motor-scooter?	All of the time 1 Sometimes 2 Never 3 Have not been on a motorcycle or motor-scooter in past 30 days 4 Do not have a helmet 5 Don't Know 77 Refused 88	V2
In the past 12 months, have you been involved in a road traffic crash as a driver, passenger, pedestrian, or cyclist?	Yes (as driver) 1 Yes (as passenger) 2 Yes (as pedestrian) 3 Yes (as a cyclist) 4 No 5 <i>If No, go to V5</i> Don't know 77 <i>If don't know, go to V5</i> Refused 88 <i>If Refused, go to V5</i>	V3 Residence
Did you have any injuries in this road traffic crash which required medical attention?	Yes 1 No 2 Don't know 77 Refused 88	V4
The next questions ask about the most serious accidental injury you have had in the past 12 months.		
In the past 12 months, were you injured accidentally, other than the road traffic crashes which required medical attention?	Yes 1 No 2 <i>If No, go to V8</i> Don't know 77 <i>If don't know, go to V8</i> Refused 88 <i>If Refused, go to V8</i>	V5
Please indicate which of the following was the cause of this injury.	Fall 1 Burn 2 Poisoning 3 Cut 4 Near-drowning 5 Animal bite/attack 6 Other (specify) 7 Don't know 77 Refused 88	V6
	Other (please specify) <input type="text"/>	V6other

Violence		
The following questions are about different experiences and behaviours that are related to violence and intentional injury.		
Question	Response	Code
In the past 12 months, how many times were you in a violent incident in which you were injured and required medical attention?	Never 1 <i>If never, go to OI</i> Rarely (1- 2 times) 2 Sometimes (3 – 5 times) 3 Often (6 or more times) 4 Don't know 77 <i>If don't know, go to OI</i> Refused 88 <i>If Refused, go to OI</i>	V11
The next questions ask about the most serious violent incidence you have had in the past 12 months.		
Please indicate which of the following caused your most serious injury in the last 12 months. (USE SHOWCARDS)	Being shot with a firearm 1 A weapon (other than a firearm) was used by the person who injured me 2 Being injured without any weapon (slapped, pushed...) 3 Other (specify) 4 Don't know 77 Refused 88	V12
	-----	V12other
Please indicate the relationship between yourself and the person(s) who caused your injury.	Intimate partner 1 Parent 2 Child, sibling, or other relative 3 Friend 4 /acquaintance/neighbor 5 Unrelated caregiver 6 Stranger (unknown) 7 Official or legal 8 Other (specify) 8 Refused 88	V13
	Other (please specify) <input type="text"/>	V13other

Oral Health

The next questions ask about your oral health status and related behaviours.

Question	Response	Code
How many natural teeth do you have?	No natural teeth 1 <i>If no natural teeth, go to O4</i> 1 to 9 teeth 2 10 to 19 teeth 3 20 to 27 teeth or more 4 28 to 32 teeth 5 Don't know 77	O1 Residence Wealth Quintiles
How would you describe the state of your teeth ?	Excellent 1 Very Good 2 Good 3 Average 4 Poor 5 Very Poor 6 Don't Know 77	O2 LOE
How would you describe the state of your gums ?	Excellent 1 Very Good 2 Good 3 Average 4 Poor 5 Very Poor 6 Don't know 77	O3 LOE
Do you have any removable dentures ?	Yes 1 No 2 <i>If No, go to O6</i>	O4
Which of the following removable dentures do you have? (RECORD FOR EACH)		
An upper jaw denture	Yes 1 No 2	O5a
A lower jaw denture	Yes 1 No 2	O5b
During the past 12 months, did your teeth or mouth cause any pain or discomfort ?	Yes 1 No 2	O6
The last time you had pain or discomfort with your teeth or mouth, what did you do first of all?	Went to consult a Traditional healer 1 Went to Health dispensary 2 Went to Public Medical Center\Hospital 3 Went to Private Medical Center\Hospital 4 Went to a Private Dental Clinic 5 Went to a Pharmacy 6 I used self-medication only 7 I did not use or do anything 8 Did other things 9 Don't know 77	X26
	Other (please Specify) _____	X26other
How long has it been since you last saw a dentist ?	Less than 6 months 1 6-12 months 2 More than 1 year but less than 2 years 3 2 or more years but less than 5 years 4 5 or more years 5 Never received dental care 6 <i>If Never, go to</i>	O7

Question	Response	Code
What was the main reason for your last visit to the dentist?	Consultation / advice 1 Pain or trouble with teeth, gums or 2 Treatment / Follow-up treatment 3 Routine check-up treatment 4 Other 5 <i>If Other, go to O8other</i>	O8
	Other (please specify) <input type="text"/>	O8other
How often do you clean your teeth?	Never 1 <i>If Never, go to O13a</i> Once a month 2 2-3 times a month 3 Once a week 4 2-6 times a week 5 Once a day 6 Twice or more a day 7	O9
Do you use toothpaste to clean your teeth?	Yes 1 No 2 <i>If No, go to O12a</i>	O10
Do you use toothpaste containing fluoride ?	Yes 1 No 2 Don't know 77	O11
Do you use any of the following to clean your teeth ? (RECORD FOR EACH)		
Toothbrush	Yes 1 No 2	O12a (LOE)
Wooden toothpicks	Yes 1 No 2	O12b (LOE)
Plastic toothpicks	Yes 1 No 2	O12c (LOE)
Thread (dental floss)	Yes 1 No 2	O12d LOE
Charcoal	Yes 1 No 2	O12eL OE
Chewstick / miswak	Yes 1 No 2	O12fLO E
Other	Yes 1 <i>If Yes, go to O12other</i> No 2	O12gL OE
Other (please specify) <input type="text"/>		O12otherLOE

How often do you replace your tooth brush?			
Have you experienced any of the following problems during the past 12 months because of the state of your teeth ? (RECORD FOR EACH)			
Difficulty in chewing foods	Yes 1 No 2		O13a
Difficulty with speech/trouble pronouncing words	Yes 1 No 2		O13b
Felt tense because of problems with teeth or mouth	Yes 1 No 2		O13c
Embarrassed about appearance of teeth	Yes 1 No 2		O13d
Avoid smiling because of teeth	Yes 1 No 2		O13e
Sleep is often interrupted	Yes 1 No 2		O13f

Question	Response	Code
Days not at work (or school) because of teeth or mouth	Yes 1 No 2	O13g
Difficulty doing usual activities	Yes 1 No 2	O13h
Less tolerant of spouse or people close to you	Yes 1 No 2	O13i
Reduced participation in social activities	Yes 1 No 2	O13j

Khat use		
Now I am going to ask you some questions about Khat chewing.		
Question	Response	Code
Have you ever chewed Khat? (USE SHOWCARD)	Yes 1 No 2 If No, go to End of STEP1	K1
Do you currently chew Khat?	Yes 1 No 2 If No, go to End of STEP1	K2

Step 2 Physical Measurements		
Blood Pressure		
Question	Response	Code
Interviewer ID	_____	M1
Device ID for blood pressure	_____	M2
Reading 1	Systolic (mmHg) _____	M4a
	Diastolic (mmHg) _____	M4b
Heart Rate Reading 1	Beats per minute _____	M16a
Reading 2	Systolic (mmHg) _____	M5a
	Diastolic (mmHg) _____	M5b
Heart Rate Reading 2	Beats per minute _____	M16b
Reading 3	Systolic (mmHg) _____	M6a
	Diastolic (mmHg) _____	M6b
Heart Rate Reading 3	Beats per minute _____	M16c
In the past two weeks, have you been treated for raised blood pressure with drugs (medication) prescribed by a doctor or other health worker?	Yes 1 No 2	M7
Height and Weight		
For women: Are you pregnant?	Yes 1 <i>If Yes, go to M 16</i> No 2	M8
Device IDs for height and weight	Height _____	M10a
	Weight _____	M10b
Height	in Centimetres (cm) _____	M11
Weight <i>If too large for scale 666.6</i>	in Kilograms (kg) _____	M12
Waist		
Waist circumference	in Centimetres (cm) _____	M14
Hip Circumference and Heart Rate		
Hip circumference	in Centimeters (cm) _____	M15

Step 3 Biochemical Measurements

Blood Glucose		
Question	Response	Code
During the past 8 hours have you had anything to eat or drink, other than water?	Yes 1 No 2	B1
Technician ID	_____	B2
Device ID	_____	B3
Time of day blood specimen taken (24 hour clock)	Hours : minutes _____ : _____ hrs mins	B4
Fasting blood glucose	mmol/l _____ . _____	B5
Today, have you taken insulin or other drugs (medication) that have been prescribed by a doctor or other health worker for raised blood glucose?	Yes 1 No 2	B6
Blood Lipids		
Total cholesterol	mmol/l _____ . _____	B7
Hdl cholesterol	mmol/l _____ . _____	B8
During the past two weeks, have you been treated for raised cholesterol with drugs (medication) prescribed by a doctor or other health worker?	Yes 1 No 2	B9

APPENDIX D. PERSONS INVOLVED IN THE 2015 KENYA STEPWise Survey for NCD Risk factors

Technical and Administrative Survey Coordinators

1. Dr. Nicholas Muragori
2. Dr. Joseph Kibachio
3. Dr. Joyce Nato
4. Dr. Gladwell Gathecha
5. Dr. Jutta Jorgensen
6. Mr. Zachary Ndegwa
7. Mr. Zachary Mwangi
8. Mr. Macdonald Obudho
9. Mr. A.A. Awes
10. Mr. Paul Waweru
11. Mr. John Bore

Regional Supervisors

1. Robert Buluma
2. Dickson Makuba
3. Emma Otieno
4. Stanley Wambua
5. Godfrey Otieno
6. Dr. Samuel Oti
7. Dr. Esther Ogara
8. Dr. Jane Onyango
9. Onesmus Kamau
10. Felister Kiberenge
11. Dorcas Kiptui
12. Eva Muchemi

Survey Teams- Supervisors

1. Dr. Alfred Maina
2. Alinoor Hapikha
3. Anne Kendagor
4. Caroline Muriuki
5. Elias Nyaga
6. George Magara
7. Dr. Gichu Muthoni
8. Ibrahim Mohamed
9. Joseph Mungai
10. Martha Ongonga
11. Peter Ochiel
12. Raphael Maritim
13. Robert Nzuli
14. Robinson Mwati
15. Samwel Mwenda
16. Scholastica Owondo
17. William Nyongo
18. Winnie Muhoro
19. Wilfred Githinji
20. Wycliffe Alubokho

Health Workers

1. Adan Issak
2. Agnes Achieng
3. Ann Mugo
4. Anthony Wachira
5. Anthony Muriuki
6. Bidalla Chuphi
7. Catherine Ahonge
8. Charity Gichugu
9. Deborah Ombui
10. Dyphine Ndenga
11. Elizabeth Maina
12. Elyas Osman
13. Florence Ndathi
14. Fraciah Mwati
15. George Githuka
16. Henry Chebii
17. Hilda Halubha
18. Jacinta Kimata
19. Janeth Setluget
20. John Kanyiki
21. Kevina Cherop Lopeta
22. Leah Baswony
23. Lilian Karugu
24. Longinus Watiangu
25. Maore Gacheri
26. Mariam Mbatha
27. Mary Ruguru
28. Maryan Abdi
29. Meshach Wambua
30. Meshack Ombongi
31. Micah Kariworeng
32. Michael Chelang'a
33. Milka Mang'ara
34. Miriam Samburu
35. Mohamud Dahir
36. Musau Kennedy
37. Obulemire Ronniey
38. Purity Mburugu
39. Salmon Odongo
40. Simon Lemooge
41. Simon Maika
42. Sophie Opiyo
43. Teresia Maina

Enumerators

1. Abdullahi Hassan
2. Agnes Njuki
3. Alex Ayew
4. Allan Ngetha
5. Amina Koba
6. Aziza Rauji
7. Calvin Ngare
8. Chepkoech Vivian
9. Chepkoech Fancy
10. Diana Lentoijoni
11. Elizabeth Njoroge
12. Emma Sisia
13. Emmanuel Isacko
14. Eric Ndunda
15. Francis Ngunjiri
16. Fridah Mbajo
17. Gilbert Onyango
18. Grace Ogallo
19. Hafsa Ibrahim
20. Isaac Miruka
21. James Kiende
22. Janet Maina
23. Julia Kimutai
24. Kennedy Gathura
25. Kevin Mutai
26. Khamis Ali
27. Lennah Gitungo
28. Lilian Patrick
29. Linet Odhiambo
30. Margaret Wambura
31. Mercy Lisangari
32. Monica Aengwo
33. Moturi Mervyn
34. Mwangi Melba
35. Pascaline Munyao
36. Patricia Njeri
37. Patrick Ntete
