2007 Fact Sheet

The **2007 Mauritius GSHS** measured alcohol and other drug use; unintentional injuries and violence; physical activity; tobacco use; and protective factors.

The 2007 Mauritius GSHS was a school-based survey of students in Forms 2, 3, and 4. A two-stage cluster sample design was used to produce data representative of all students in Forms 2, 3, and 4 in Mauritius. At the first stage, schools were selected with probability proportional to enrollment size. At the second stage, classes were randomly selected and all students in selected classes were eligible to participate. The school response rate was 96%, the student response rate was 91%, and the overall response rate was 88%. A total of 2,278 students participated in the Mauritius GSHS. Students self-reported their responses to each question on a computer scannable answer sheet. For comparison purposes, only students aged 13-15 years are included in the analyses for this fact sheet.
