2008 Fact Sheet

The **2008 Tunisia GSHS** measured alcohol and other drug use; unintentional injuries and violence; hygiene; dietary behaviours and overweight; physical activity; tobacco use; mental health; and protective factors.

The 2008 Tunisia GSHS was a school-based survey of students in grades 7th, 8th, and 9th. A two-stage cluster sample design was used to produce data representative of all students in grades 7th, 8th, and 9th in Tunisia. At the first stage, schools were selected with probability proportional to enrollment size. At the second stage, classes were randomly selected and all students in selected classes were eligible to participate. The school response rate was 100%, the student response rate was 83%, and the overall response rate was 83%. A total of 2,870 students participated in the Tunisia GSHS. Students self-reported their responses to each question on a computer scannable answer sheet. For comparison purposes, only students aged 13-15 years are included in the analyses for this fact sheet.
