## Summary

---

The Global Adult Tobacco Survey (GATS), a component of Global Tobacco Surveillance System (GTSS), is a global standard for systematically monitoring adult tobacco use and tracking key tobacco control indicators. GATS is a nationally representative household survey of adults 15 years of age or older using a standard core questionnaire, sample design, and data collection and management procedures that were reviewed and approved by international experts. GATS is intended to enhance the capacity of countries to design, implement and evaluate tobacco control interventions.

GATS is designed to produce national and sub-national estimates among adults across countries. The target population includes all non-institutionalized men and women 15 years of age or older who consider the country to be their usual place of residence. All members of the target population are sampled from the household that is their usual place of residence. All GATS countries use country-specific stratified multi-stage cluster sampling designs and an interview consisting of a household screening component and an individual component administered to the selected respondent. Data is collected using electronic handheld devices.

GATS Thailand was conducted in 2008-2009 using a three-stage stratified cluster sample design. The initial sample size is 22,780 with 20,566 completed cases in Bangkok metropolitan area and the Central, North, Northeast and South regions. The GATS Thailand questionnaire includes core questions about background characteristics, tobacco smoking, smokeless tobacco, cessation, secondhand smoke, economics, media, and knowledge, attitudes and perceptions, and country-specific questions about hand-rolled cigarettes and pictorial health warnings. Questions were adapted in each section, then reviewed and approved by the questionnaire expert review committee. The questionnaire was administered in the Thai language using a software program developed by NSO for electronic data collection using handhelds.

The data file does not contain personal identifying information to ensure and protect confidentiality. Due to the complex sample design, clustering, stratification and sample weights should be taken into account in the data analysis in order to obtain proper point estimates and variances. The stratification, cluster and sample weight variables are `gatsstrata`, `gatscluster` and `gatsweight`, respectively.
