

Third Community Health and Nutrition Project (CHN 3) - Nutrition education - Lactating women (LW)

Programme: Third Community Health and Nutrition Project (CHN 3)

Programme Data

Programme Description

CHN 3 focused on capacity building, health information systems, education and service delivery in a province-based model in five provinces.

Program type

Large scale programmes

Cost

US\$ 3.6 million investment by the World Bank. US\$ 0.6 million by the Government of Indonesia.

References

WHO (2013) *Essential Nutrition Actions ? Improving maternal, newborn, infant and young child health and nutrition*, which provides a compact of WHO guidance on nutrition interventions targeting the first 1000 days of life. Part I presents the interventions currently recommended by WHO, summarizes the rationale and the evidence, and describes the actions require to implement them. Part II provides an analysis of community-based interventions aimed at improving nutrition and indicates how effective interventions can be delivered in an integrated fashion. It shows how the essential nutrition actions described in the first part have been implemented in large-scale programmes in various settings, what the outcomes have been, and to examine the evidence for attribution of changes in nutritional outcomes to programme activities. Additionally, there is a section describing findings from cash transfer programmes. This summary of CHN 3 is retrieved from the ENA Part II where CHN 3 is one of 32 large-scale community-based programs that has been reviewed in detail and evaluated.

Implementing organisations

Funding sources

- Bilateral and donor agencies and lenders
 - The World Bank

Action data

Start date	1993
End date	2001
Country(ies):	Indonesia
Status:	Completed
Area:	Urban Rural Peri-urban
Place:	Five provinces in Indonesia
Topic:	Nutrition education and counselling
Target group:	Lactating women (LW) Pregnant women (PW)

Delivery: Community-based

Target population size : Five provinces in Indonesia

Coverage level (%): Five provinces in Indonesia

Outcome indicator(s): Weight-for-age z-score (WAZ)

M&E system: From 1989 to 2003 underweight (<-2 SD WAZ) decreased from 37.5% to 27.5% (0.71 ppt/year) despite the financial crisis of the early 1990s. This decrease may be partially attributed to a reduction in birth-rate in the lowest quintile of the population.

Outcome reported by social determinants: None

Other lessons learnt : Attempts to decentralize health interventions to the provincial level with CHN3 faced challenges of implementation and monitoring. Lack of baseline and surveillance data made effectiveness of these projects difficult to define.

Typical problems Solutions
