SUMMARY OF PRODUCT CHARACTERISTICS
1. Name of the Medicinal Product
Cycloserine 250mg Capsules

2. Qualitative and Quantitative Composition
Each hard capsule contains:
Cycloserine 250 mg

For full list of excipients see point 6.1

3. Pharmaceutical Form
Hard Capsules.

4. Clinical Particulars

4.1 Therapeutic indications
Cycloserine 250mg Capsules is indicated in combination with other antituberculosis agents for the treatment of all forms of tuberculosis caused by *Mycobacterium tuberculosis*.

Cycloserine 250mg Capsules is only indicated as a second line antimycobacterial drug when resistance to or toxicity from primary drugs has developed.

4.2 Posology and method of administration
Oral use
Cycloserine 250mg Capsules must always been given in combination with other antituberculosis agents.

Adults:
The usual dose is 500 mg to 1 g daily divided into two daily doses. A daily dosage of 1 g should not be exceeded.

Children:
Experience in children is limited. No paediatric dose has been established. A dose of 10mg/kg/day, divided into two daily doses, has been suggested. If available, therapeutic drug monitoring may be useful. Peak concentrations between 15-40 µg/ml have been recommended as appropriate.

Renal impairment:
Data on cycloserine dosing in renal impairment are very limited. If use in this patient population is deemed necessary, it has been suggested that 250 mg be given every 24 hours if creatinine clearance is lower than 10 ml/min. Also in patients with creatinine clearance of 10-50 ml/min, an increased dosing interval should be considered. Patients with clinically significant renal dysfunction should be carefully clinically monitored for signs of toxicity, and doses should be adjusted accordingly.

Hepatic impairment:
Data on cycloserine use in hepatic impairment are scarce. Patients should be carefully monitored for signs of toxicity.

Cycloserine can be taken with or without food.
Duration of therapy
Therapy should be continued long enough to prevent relapse. The duration of antituberculous therapy depends on the regimen chosen, the patient’s clinical and radiographical responses, smear and culture results, and susceptibility studies of *Mycobacterium tuberculosis* isolates from the patient or the suspected source case.

If therapy is interrupted, the treatment schedule should be extended to a later completion date depending, e.g. on the length of the interruption, the time during therapy (early or late) or the patient’s status.

4.3 Contraindications
Hypersensitivity to the active substance or to any of the excipients.
Epilepsy.
Psychiatric disease (e.g. depression, severe anxiety, psychosis).
Concurrent use of alcohol (see 4.5).

4.4 Special warnings and precautions for use
Before initiation of treatment, bacterial susceptibility to the drug should be established.

Cycloserine 250mg Capsules should be discontinued or the dosage reduced if the patient develops symptoms of CNS toxicity, such as convulsions, psychosis, somnolence, depression, confusion, hyperreflexia, headache, tremor, vertigo, paresis, or dysarthria.

The drug should be discontinued if a hypersensitivity reaction (e.g. rash, hepatitis) occurs.

Neuropsychiatric status should be assessed at least at monthly intervals and more frequently if neuropsychiatric symptoms develop. The most dangerous risk of cycloserine is that of suicide, so mood should be carefully watched and any undue depression or personality change observed should be immediately reported.

Since CNS toxicity is more common with higher doses, patients receiving more than 500 mg daily should be particularly closely observed.

Cycloserine should be used very cautiously in patients with renal failure (see section 4.2).

4.5 Interaction with other medicinal products and other forms of interaction
Concurrent administration of cycloserine with ethionamide, isoniazid or alcohol potentiates the neurotoxicity of cycloserine.

4.6 Pregnancy and lactation
Animal data do not indicate any teratogenicity. Data in human pregnancy are limited. Cycloserine should be given to pregnant women only if clearly needed and when there are no suitable alternatives.

Cycloserine passes into the breast milk. No adverse effects have been observed in breast-fed infants whose mothers were receiving cycloserine.

4.7 Effects on ability to drive and use machines
No studies on the effects on the ability to drive and use machines have been performed. Nevertheless, the clinical status of the patient and the adverse reaction profile of Cycloserine
250mg Capsules should be borne in mind when considering the patient’s ability to drive or operate machinery. Negative effects of cycloserine on the ability to drive and use machines may be synergistic with the effects of alcohol (see section 4.3).

4.8 Undesirable effects

The most frequent and most important adverse reactions of cycloserine are psychiatric and central nervous system (CNS) disorders as detailed below. CNS adverse reactions appear to be dose-related, and occur within the first 2 weeks of therapy in about 15 to 30% of patients. CNS symptoms generally disappear when the drug is discontinued.

The adverse events considered at least possibly related to the treatment are listed below by body system, organ class and absolute frequency. They are not based on adequately sized randomized controlled trials, but on published literature data generated mostly during post-approval use. Therefore, often no frequency data can be given. Frequencies are defined as very common (≥1/10), common (≥1/100, <1/10), uncommon (≥1/1000, <1/100), rare (≥1/10,000, <1/1000), very rare (≥1/10,000), ‘not known’.

Nervous system disorders

Very common: headache, tremor, dysarthria, vertigo.

Not known: major and minor clonic seizures, convulsions, coma.

Psychiatric disorders

Very common: depression, confusion, anxiety, nervousness, drowsiness, dizziness, lethargy.

Cardiac disorders

Rare: Cardiac arrhythmias and sudden development of congestive heart failure in patients receiving 1 g or more per day.

General disorders

Rare: Hypersensitivity reactions, including rash, photosensitivity or hepatitis.

4.9 Overdose

Acute toxicity can occur when more than 1 g is ingested by an adult. Chronic toxicity is dose related and tends to occur if more than 500 mg are administered daily. Toxicity commonly affects the central nervous system. Effects may include headache, vertigo, confusion, drowsiness, hyperirritability, paraesthesia, slurred speech and psychosis. Following ingestion of larger doses, paresis, convulsions and coma often occur.

Symptomatic and supportive therapy is recommended. Activated charcoal may be more effective in reducing absorption than emesis or gastric lavage. Cycloserine is removed by haemodialysis.

5. Pharmacological Properties

5.1 Pharmacodynamic properties

Pharmacotherapeutic group: Antimycobacterial

ATC Code for cycloserine: J04AB01

Properties

Cycloserine is a broad-spectrum antibiotic that is bacteriostatic to Mycobacterium tuberculosis at the clinically recommended doses.
Mechanism of action
Cycloserine is an analog of the amino acid D-alanine. It interferes with peptidoglycan formation and bacterial cell wall synthesis.

5.2 Pharmacokinetic properties
Absorption: Cycloserine is rapidly and almost completely absorbed after oral administration. Following single dose administration of Cycloserine 250mg capsules in healthy volunteers, the mean (CV) cycloserine $C_{max}$ value was 10.03 μg/ml (25.08%) and the corresponding values for $AUC_{0-inf}$ was 228.38 μg/h/ml (33.79 %) and $AUC_{0-t}$ was 159.45 μg/h/ml (27.74%). The median (range) cycloserine $t_{max}$ value was 0.75 (0.5-4.5) hours. With repeated doses of cycloserine, there is some accumulation of the drug during the first 3 days of therapy.

Distribution: Cycloserine is widely distributed into body tissues and fluids including lungs, ascitic fluid, pleural fluid and synovial fluid, in concentrations approximately equal to plasma concentrations of the drug. Cycloserine is bound to plasma proteins to a low extent (<20%).

Elimination: The plasma half-life of cycloserine has been estimated to range between 4 and 30 hours with a mean of 10 hours. In patients with normal renal function, 60 - 70% of an oral dose of cycloserine is excreted unchanged in urine by glomerular filtration. 30-40% of the dose is metabolized in the liver. The metabolites are excreted in the urine. Small amounts of the drug are excreted in faeces.

5.3 Preclinical safety data
Conventional studies of safety, pharmacology, repeated dose toxicity, genotoxicity, carcinogenic potential and toxicity to reproduction have not raised any special safety concerns for humans.

6. Pharmaceutical Particulars

6.1 List of Excipients
*Information on excipients removed upon request of the company.*

6.2 Incompatibilities
Not applicable

6.3 Shelf life
Alu/Alu strip pack: 24 months
Alu/Alu cold form blister pack: 36 months

6.4 Special precautions for storage
Store in the original package below 25°C.
Keep out of the reach and sight of children.

6.5 Nature and contents of container
Aluminium foil/ Aluminium foil strip of 10 capsules.
Aluminium/ Aluminium cold form blister of 10 capsules.

6.6 Special Precaution for disposal
No special requirements.
Any unused product or waste material should be disposed off in accordance with local requirements.

7. Supplier

Macleods Pharmaceuticals Ltd.
304, Atlanta Arcade,
Marol Church Road,
Andheri (East),
Mumbai- 400 059,
India
Tel.:0091 22 6676 2800
Fax: 0091 22 28216599
E-mail: exports@macleodspharma.com

8. WHO Reference Number (Prequalification Programme)

TB154

9. Date of first prequalification/ last renewal

23 March 2007
