SUMMARY OF PRODUCT CHARACTERISTICS
1. NAME OF THE MEDICINAL PRODUCT

Ethionamide 250 mg Tablets*

2. QUALITATIVE AND QUANTITATIVE COMPOSITION

Each film-coated tablet contains 250 mg ethionamide.

Excipients with known effects: FD&C yellow #6/sunset yellow FCF aluminium lake. May cause allergic reactions.

For a full list of excipients, see section 6.1.

3. PHARMACEUTICAL FORM

Film-coated tablet.

Ethionamide 250 mg Tablets are orange coloured, circular, biconvex, film-coated tablets, plain on both sides.

The tablets should not be divided.

4. CLINICAL PARTICULARS

4.1 Therapeutic indication

Ethionamide is indicated in combination with other antituberculosis agents for the treatment of all forms of tuberculosis caused by *Mycobacterium tuberculosis*.

Ethionamide is only indicated as a second-line antimycobacterial drug when resistance to or toxicity from first-line drugs has developed.

Consideration should be given to official treatment guidelines for tuberculosis, e.g those of WHO: ([http://whqlibdoc.who.int/publications/2010/9789241547833_eng.pdf](http://whqlibdoc.who.int/publications/2010/9789241547833_eng.pdf))

4.2 Posology and method of administration

Ethionamide 250 mg Tablets should be prescribed by a physician experienced in the management of multidrug resistant tuberculosis.

Oral use.

Ethionamide 250 mg Tablets must always been given in combination with other antituberculosis agents.

The optimum daily adult dose is 15-20 mg/kg. The usual dose is 500 mg to 1 g daily, depending on body weight and tolerance. This daily dose can be taken either at a single occasion or split up

* Trade names are not prequalified by WHO. This is under local drug regulatory authority’s responsibility. Throughout this WHOPAR the proprietary name is given as an example only.
in two doses over the day to improve tolerability. Ethionamide 250 mg Tablets may be taken with
or without food. Intake with food may improve gastrointestinal tolerability.

In order to assess and improve tolerability, therapy may be initiated at a dose of 250 mg daily
with gradual titration to optimal doses as tolerated by the patient. Doses should be increased by
250 mg increments over a few days until the full dose is reached.

**Children**
Optimum doses for children have not been established. This, however, does not preclude use of
the drug when crucial to therapy, i.e. when the organisms are definitely resistant to primary
therapy and there is systemic dissemination of the disease, or other life-threatening complications
of tuberculosis. A total daily paediatric dose of 15-20 mg/kg is recommended, and can be taken
either at a single occasion or split up in two doses over the day to improve tolerability (see also
section 5.2).

**Hepatic and renal impairment**
Ethionamide is almost completely metabolised in the liver. Its use should be avoided in patients
with severe hepatic impairment. No data are available for patients with mild to moderate hepatic
impairment. Very little ethionamide is excreted renally, and dose adjustments are not expected to
be necessary in patients with renal impairment.

**Duration of therapy**
The duration of antituberculous therapy depends on the regimen chosen, the patient’s clinical and
radiographical responses, smear and culture results, and susceptibility studies of *Mycobacterium
tuberculosis* isolates from the patient or the suspected source case.

If therapy is interrupted, the treatment schedule should be extended to a later completion date
depending, e.g. on the length of the interruption, the time during therapy (early or late) and the
patient’s status.

When a dose is missed and this is noticed within 6 hours, the missed dose should be taken as soon
as possible. The next regular dose should be taken as scheduled. If noticed later, then the normal
dose should be taken when it is due. No double dose should be taken to make up for forgotten
individual doses.

**4.3 Contraindications**
- Hypersensitivity to ethionamide or to any of the excipients
- Severe hepatic impairment.

**4.4 Special warnings and special precautions for use**
**Resistance**
The use of ethionamide alone in the treatment of tuberculosis results in rapid development of
resistance. It is essential, therefore, to co-administer suitable other antituberculous drug or drugs,
the choice being based on results of susceptibility testing. However, therapy may be initiated
prior to receiving the results of susceptibility tests, as deemed appropriate by the physician.
Liver toxicity
Toxic hepatitis, obstructive jaundice, acute hepatic necrosis, as well as modest elevations of hepatic transaminase levels, bilirubin and alkaline phosphatase with or without jaundice, have been described during ethionamide treatment. Baseline liver function tests should be performed prior to therapy, and serum transaminases should be monitored every 2-4 weeks during therapy. If transaminase levels exceed five times the ULN, with or without symptoms, or three times the ULN with jaundice and/or hepatitis symptoms, Ethionamide 250 mg Tablets and other potentially hepatotoxic co-administered drugs should be discontinued temporarily until the laboratory abnormalities have resolved. These medications may then be reintroduced sequentially to determine which drug (or drugs) is (are) responsible for the hepatotoxicity. An increased risk of hepatotoxicity has been described in patients with diabetes mellitus.

Neurologic effects
Psychotic disturbances, encephalopathy, peripheral and optic neuritis, as well as a pellagra-like syndrome have been reported with ethionamide. In some cases, these symptoms have improved with nicotinamide and pyridoxine substitution. Therefore, concurrent administration of pyridoxine is recommended to prevent neurotoxic effects of ethionamide.

Blood glucose
Since ethionamide treatment has been associated with hypoglycaemia, blood glucose should be determined prior to and periodically throughout therapy with Ethionamide 250 mg Tablets. Blood glucose control in diabetes mellitus may be more difficult during ethionamide treatment, including an increased risk of hypoglycaemia.

Hypothyroidism
Periodic monitoring of thyroid function is recommended as hypothyroidism, with or without goiter, has been reported with ethionamide therapy.

Allergic reactions
Ethionamide may cause severe allergic hypersensitivity reactions with rash and fever. If this occurs, Ethionamide 250 mg Tablets must be discontinued.

Visual disturbances
Since ethionamide may cause visual disturbances, ophthalmoscopy is recommended before and periodically during therapy with Ethionamide 250 mg Tablets.

4.5 Interaction with other medicinal products and other forms of interaction
Co-administration of ethionamide and rifampicin has been associated with a high frequency of hepatitis with jaundice. In one study, hepatitis occurred in 4.5% of patients co-treated with rifampicin and ethionamide. The mortality in this subset of patients was 26%. Co-administration should be avoided unless the benefits are considered to outweigh the risks, and if so, the patient should be regularly monitored for liver function test abnormalities, as well as clinical signs and symptoms of liver dysfunction.

Co-administration of ethionamide and isoniazid increased the serum concentration of the latter in both rapid and slow acetylators. If co-administration is deemed necessary supplemental pyridoxine should be given; also monitor for adverse effects of isoniazid (peripheral neuritis, hepatotoxicity, encephalopathy).
A reversible pellagra-like encephalopathy has occurred when ethionamide and cycloserine were coadministered. This may have been caused by disturbances in pyridoxine metabolism.

Excessive use of ethanol during ethionamide therapy has been reported to precipitate a psychotic reaction and should thus be avoided.

4.6 Pregnancy and lactation
Ethionamide has been demonstrated to have a teratogenic potential in rabbits and rats (see section 5.3). Some data indicate an excess of congenital malformations when ethionamide is given to pregnant women. Therefore ethionamide should be withheld from women who are pregnant, or are likely to become pregnant during therapy, unless the benefit is considered to outweigh the risk.

It is not known whether ethionamide is excreted into human milk. In case of breast-feeding during treatment with Ethionamide 250 mg Tablets, the baby should be monitored for side effects of ethionamide (see section 4.8).

4.7 Effects on ability to drive and use machines
No studies on the effects on the ability to drive and use machines have been performed. Nevertheless, the clinical status of the patient and the adverse reaction profile of Ethionamide 250 mg Tablets should be borne in mind when considering the patient’s ability to drive or operate machinery.

4.8 Undesirable effects
Adverse events considered to be at least possibly related to treatment with ethionamide are listed below by body system, organ class and absolute frequency. Frequencies are defined as very common (≥1/10), common (≥1/100, <1/10), uncommon (≥1/1000, <1/100), rare (≥1/10,000, <1/1000) or very rare (≤1/10,000). In addition, adverse events identified during post-approval use of ethionamide are listed (frequency category: ‘not known’). Since they are reported voluntarily from a population of unknown size, estimates of frequency cannot be made. These events have been included for their potential causal connection to ethionamide, taking also into account their seriousness and the number of reports.

**Blood and lymphatic system disorders**
*Not known*: thrombocytopenia.

**Metabolism and nutrition disorders**
*Not known*: pellagra-like syndrome, hypothyroidism, hypoglycaemia.

**Psychiatric disorders**
*Not known*: psychotic reactions.

**Nervous system disorders**
*Common*: headache, dizziness, drowsiness, asthenia, paresthesia
*Not known*: encephalopathy, peripheral neuritis, olfactory disturbance.

**Cardiovascular disorders**
*Not known*: postural hypotension.
Gastrointestinal disorders

Very common: epigastric discomfort, abdominal pain, anorexia, nausea, vomiting, diarrhoea

Not known: metallic taste and sulphurous belching, increased salivation, taste disorders.

Hepatobiliary disorders

Very common: elevated serum transaminases

Common: hepatitis, jaundice.

Skin and subcutaneous tissue disorders

Not known: rash, urticaria, acne, photosensitivity, stomatitis, alopecia, purpura.

Reproductive system and breast disorders

Not known: gynaecomastia, menstrual disturbance, impotence.

Eye disorders

Not known: visual disturbances (e.g. diplopia, blurred vision, optic neuritis).

Ear disorders

Not known: ototoxicity.

General disorders and administration site conditions

Not known: hypersensitivity reaction (rash, fever).

4.9 Overdose

Cases of severe overdosage have not been described in the literature. In case of overdose, treatment should be symptomatic. Ethionamide is not dialyzable.

5. PHARMACOLOGICAL PROPERTIES

5.1 Pharmacodynamic properties

Ethionamide is bacteriostatic against *M. tuberculosis* at therapeutic concentrations, but may be bactericidal at higher concentrations. Ethionamide is also active against *M. kansasii, M. leprae* and some strains of *M. avium*-complex. The exact mechanism of action of ethionamide has not been fully elucidated, but the drug appears to inhibit peptide synthesis in susceptible organisms. Drug resistance develops rapidly when ethionamide is given as monotherapy.

5.2 Pharmacokinetic properties

Absorption

Ethionamide is nearly completely absorbed upon oral administration. Following single dose administration of Ethionamide 250 mg Tablets in healthy volunteers, the mean (± SD) ethionamide $C_{\text{max}}$ value was 2.26 µg/ml (± 0.47), the corresponding value for AUC$_{0-t}$ was 8.46 µg.h/ml (± 1.63) and the mean (± SD) ethionamide $t_{\text{max}}$ value was 1.08 (± 0.55) hours.
Distribution and elimination
Plasma protein binding is approximately 30%, and the volume of distribution has been reported to be approximately 80 liters. Ethionamide undergoes extensive hepatic metabolism into several different metabolites, with only approximately 1% of a given dose excreted unchanged in the urine. Ethionamide-sulfoxide is the major metabolite; it has been reported to have antibacterial activity. The plasma half-life of ethionamide is approximately 2-3 hours.

Special populations
Renal/hepatic impairment: Pharmacokinetic data are available neither for patients with renal impairment nor for patients with mild to moderate hepatic impairment (see section 4.2).

Children
Data on the pharmacokinetics of ethionamide in paediatric patients are scarce. One study in children aged 0-12 years showed that a daily dose of 15-20 mg/kg yielded C_{max} values above a target concentration of 2.5µg/ml in the majority of patients. This target concentration was based on published expert opinion. Exposures tended to be lower in younger patients, particularly in those < 2 years of age.

5.3 Preclinical safety data
Carcinogenic effects
A bioassay for possible carcinogenicity was conducted by administering ethionamide in feed to Fischer 344 rats and B6C3F1 mice. Groups of 35 rats and 34 or 35 mice of each sex were administered ethionamide at either 1,500 or 3,000 ppm for the rats, and either 1,000 or 2,000 ppm for the mice. It is concluded that under the conditions of this bioassay, ethionamide was not carcinogenic in either Fischer 344 rats or B6C3F1 mice.

Teratogenic effects
Animal studies conducted with ethionamide indicate that the drug has a teratogenic potential in rabbits and rats. The doses used in these studies on a mg/kg basis were considerably in excess of those recommended in humans. There are no adequate and well-controlled studies in pregnant women.

Mutagenic effects
Ethionamide was not found to be mutagenic, as shown by Ames Salmonella & micronuclei Assay Test.

6. PHARMACEUTICAL PARTICULARS

6.1 List of excipients
Core tablet: Colloidal anhydrous silica, magnesium stearate, microcrystalline cellulose, polysorbate 80, povidone and sodium starch glycolate.
Seal coating: Hyromellose and polyethylene glycol.
Film coating (Opadry 02F83057 Orange): FD&C yellow #6/sunset yellow FCF aluminium lake, hyromellose, polyethylene glycol, talc and titanium dioxide.

6.2 Incompatibilities
Not applicable.

6.3 Shelf life
36 months
6.4 **Special precautions for storage**
Do not store above 30°C.

6.5 **Nature and contents of container**
Blister pack:
White opaque PVDC/PVC/Alu blisters. 10 tablets per blister.

Bottle pack:
White round HDPE bottle with CRC cap. 100 tablets per bottle.

6.6 **Instructions for use and handling and disposal**
No special requirements.
Any unused product or waste material should be disposed of in accordance with local requirements.

7. **SUPPLIER**
