

English

Rotavirus Vaccine, Live Attenuated (Oral) Liquid ROTASIIL - Liquid

DESCRIPTION

ROTASIIL-Liquid [Rotavirus Vaccine, Live Attenuated (Oral), Liquid] supplied by Serum Institute of India Pvt. Ltd. is a Liquid Bovine Human Reassortant Rotavirus-Pentavalent Vaccine (LBRV-PV). The vaccine constitutes five viruses (Human and Bovine reassortant strains) of serotype G1, G2, G3, G4, and G9. All these strains constitute VP7 gene of respective serotype from human strains reassorted with bovine (UK) rotavirus. Each strain is propagated in VERO cells individually; and all five strains are blended before filling.

ROTASIIL-Liquid is available as ready to use liquid formulation and the product has the appearance of yellowish translucent liquid with possible presence of inherent product aggregates. The vaccine contains no preservatives. ROTASIIL-Liquid is for oral administration and not for injection. The vaccine conforms to I.P. and World Health Organization (W.H.O.) requirements.

COMPOSITION

Each dose of 2 ml contains:
Live Attenuated Bovine - Human Rotavirus Reassortant [G1, G2, G3, G4 and G9]* > 10^{5.6} FFU / Serotype.

*Grown on vero cells.

Excipients: Citric Acid Anhydrous, Potassium Phosphate Dibasic Anhydrous, Sucrose, Hydrolyzed Gelatin, Zinc Chloride, Calcium Chloride Dihydrate, Sodium citrate tribasic dihydrate, Eagle's MEM (Minimum Essential Medium) with Hank's Salts, Glutamine, Sodium Bicarbonate and Water for injection.

This vaccine contains no Preservatives.

Dose : 2 ml - 1 dose by oral administration.

INDICATION

ROTASIIL-Liquid is indicated for active immunization of healthy infants from the age of 6 weeks for the prevention of gastroenteritis due to rotavirus infection when administered as a 3-dose series. The three dose regimen should be completed by one year of age.

CONTRAINDICATIONS

Hypersensitivity to any component of the vaccine is a contraindication to vaccine. Individuals who develop symptoms suggestive of hypersensitivity after receiving a dose of ROTASIIL-Liquid should not receive further doses. Infants with a history of uncorrected congenital malformation of the gastrointestinal tract that would predispose the infant for intussusception should not receive vaccine. Individuals with Severe Combined Immunodeficiency Disease (SCID) should not receive vaccine as cases of gastroenteritis associated with other live rotavirus vaccines have been reported in infants with SCID. History of intussusception (IS) is a contraindication to vaccine administration.

WARNINGS and PRECAUTIONS

No safety or efficacy data of ROTASIIL-Liquid is available in immunocompromised infants, infants infected with HIV or infants with chronic gastroenteritis. Administration of ROTASIIL-Liquid may be considered with caution in immunocompromised infants and infants in close contact with immunodeficient persons if in the opinion of the physician the benefit far outweigh the risks of vaccine. Similarly, acute infection or febrile illness may be a reason for delaying the administration of ROTASIIL-Liquid, if in the opinion of the physician the benefits far outweigh the risks of vaccine. Low-grade fever and mild upper respiratory tract infection are not contraindications to ROTASIIL-Liquid.

Available published data shows a small increased incidence of intussusception (IS) following other live oral Rotavirus vaccines especially after the first dose. The safety data from the clinical trials of ROTASIIL (already licensed lyophilized formulation of BRV-PV) did not show any increased risk of IS when compared with placebo. In Phase III trial, no intussusception was reported in ROTASIIL-Liquid and ROTASIIL groups. However, health care providers should carefully evaluate cases with symptoms suggestive of IS.

Similar to other rotavirus vaccines, vaccination with ROTASIIL-Liquid may not protect all vaccine recipients against rotavirus infection. Also, ROTASIIL-Liquid will not provide protection against gastroenteritis caused by the other pathogens.

Drug Interactions

Immunosuppressive therapies including irradiation, antimetabolites, alkylating agents, cytotoxic drugs and corticosteroids (used in greater than minimal doses), may reduce the immune response to vaccines.

ROTASIIL-Liquid can be administered concomitantly with other vaccines of the infant immunization programme, including combined diphtheria, tetanus toxoid and pertussis vaccine (DTP), inactivated polio virus vaccine (IPV), oral polio vaccine (OPV), H. influenzae type b conjugate (Hib), hepatitis B vaccine. No interaction studies have been performed with ROTASIIL-Liquid in infants with other medicinal products. In phase 2/3 study of ROTASIIL-Liquid, three doses of either ROTASIIL-Liquid or ROTASIIL (freeze-dried) were administered 4 weeks apart (minimum interval of 4 weeks and maximum of 6 weeks). All subjects received concomitantly other UIP vaccines as per the national immunization schedule (DTwP-HepB-Hib, bOPV, IPV). Other than UIP, OPV was also administered during national / sub-national immunization days; BCG and pneumococcal vaccines were also allowed during the study period.

Pregnancy

ROTASIIL-Liquid is not indicated for adults, including women of child-bearing age and should not be administered to pregnant females. Animal reproduction studies have not been conducted with ROTASIIL-Liquid.

ADVERSE REACTIONS

In the phase III trial of ROTASIIL, no differences were detected between ROTASIIL and placebo groups in the post vaccination rates of solicited adverse events within 7 days of each dose of vaccine. Similarly, in the phase II trial of ROTASIIL-Liquid, no differences were detected between ROTASIIL-Liquid and ROTASIIL groups in the post-vaccination rates of solicited adverse events within 7 days of each dose of vaccine. These events in decreasing order of frequency were:

Fever [64.6% in ROTASIIL-Liquid group and 64.6% in ROTASIIL group], irritability [51.5% in ROTASIIL-Liquid group and 50.5% in ROTASIIL group], decreased appetite [31.9% in ROTASIIL-Liquid group and 31.6% in ROTASIIL group], decreased activity level [23.2% in ROTASIIL-Liquid group and 22.3% in ROTASIIL], vomiting [17.9% in ROTASIIL-Liquid group and 13.8 % in ROTASIIL] and diarrhea [12.1% in ROTASIIL-Liquid group and 13.8% in ROTASIIL group]. The incidence of all solicited events was similar in ROTASIIL-Liquid and ROTASIIL groups. Most of these events were of short duration and predominantly mild (74% of episodes) in severity. It should be noted that in the phase 3 study, ROTASIIL-Liquid and ROTASIIL were administered to all children concomitantly with DTwP vaccine, which is known to cause a level of reactogenicity similar to that observed in this study.

The occurrence of unsolicited adverse events was monitored throughout the phase 3 trial and the incidence was similar in both the groups. The most frequent serious adverse events (SAE) observed included bronchiolitis, lower respiratory tract infection and gastroenteritis. Only one SAE of gastroenteritis that occurred within 7 days post-vaccination in ROTASIIL group was considered to be causally related. No death as well as intussusception case was reported in this study.

Further, in Phase III trial of ROTASIIL, total thirteen cases of intussusception were diagnosed; 6 occurred in the ROTASIIL arm and 7 in the placebo arm. None occurred within 28 days of receiving a dose of ROTASIIL or placebo. None were related to study vaccination or led to discontinuations from the study.

DOSAGE AND ADMINISTRATION

ROTASIIL-Liquid is for ORAL ADMINISTRATION ONLY AND MUST NOT BE ADMINISTERED PARENTERALLY.

Dosage:

ROTASIIL-Liquid should be administered as a 3-dose regimen, 4 weeks apart, beginning at 6 weeks of age. The three dose regimen should be completed by one year of age. ROTASIIL-Liquid may be co-administered with other routine childhood immunizations (i.e., Diphtheria, Tetanus and Pertussis [DTwP], Hepatitis B vaccine, H. influenzae type b (Hib) vaccine, inactivated polio vaccine (IPV) and Oral Polio Vaccine (OPV)). Because of the typical age distribution of rotavirus gastroenteritis, rotavirus vaccination of children > 24 months of age is not recommended. Based on recommendations from the World Health Organization, if the routine childhood immunizations are initiated later than 6 weeks of age and/or at a longer dose interval than 4-weeks, ROTASIIL-Liquid can still be administered, by itself or concomitantly with DTwP. There are no restrictions on the infant's consumption of food or liquid, including breast milk, either before or after vaccination with ROTASIIL-Liquid.

It is recommended that infants who receive ROTASIIL-Liquid as the first dose should complete the three dose series with ROTASIIL-Liquid. There is no data on safety, immunogenicity or efficacy of ROTASIIL-Liquid when administered interchangeably with other available rotavirus vaccines.

In case that an incomplete dose is administered (the baby spits up or regurgitates most of the vaccine), a single replacement dose may be administered at the same vaccination visit*. The baby may continue to receive the remaining doses as per schedule. *Physician's discretion is advised

Dosage administration:

Each single oral dose of ROTASIIL-Liquid is 2 ml in volume. The vaccine is available as ready to use vial. If the integrity of the vaccine vial has been compromised, that particular vial must be discarded. The content of vial should be inspected visually for any foreign particulate matter and/or abnormal physical appearance prior to administration. In the event of either being observed, discard the vaccine. Vaccine must be used immediately. If not used immediately, it can be held for a period of maximum 6 hours, provided, a syringe* is used to cap the opening of the vial adapter and the entire assembly is stored at 2 to 8°C.

*Use fresh syringe for administration of each dose. The vaccine vial monitor (see figure), for this type of vaccine is attached to the vial cap and should be discarded when the vaccine is being used. Any unused vaccine or waste material should be disposed-off in accordance with local requirements.

The vaccine must not be mixed with other medicinal products.

For administration of vaccine orally refer section "Instructions for use".

STORAGE

ROTASIIL-Liquid must be stored between +2°C to +8°C.

Protect from light. DO NOT FREEZE.

SHELF LIFE

24 months. Do not use after expiry date.

PRESENTATION

4 ml - 2 doses vials

THE VACCINE VIAL MONITOR (VVM) (Optional)

Vaccine Vial Monitors (VVMs) are on the cap of ROTASIIL-Liquid supplied through Serum Institute of India Pvt. Ltd. This is a time-temperature sensitive dot that provides an indication of the cumulative heat to which the vial has been exposed. It warns the end user when exposure to heat is likely to have degraded the vaccine beyond an acceptable level.

The interpretation of the VVM is simple. Focus on the central square. Its colour will change progressively. As long as the colour of this square is lighter than the colour of the outer circle, then the vaccine can be used. As soon as the colour of the central square is the same colour as the outer circle or of a darker colour than the outer circle, then the vial should be discarded.

INSTRUCTIONS FOR USE

To administer the vaccine orally:

1. Remove plastic cap from the vials containing vaccine.

2. Fit the vial adapter on the vaccine vial. Connect the syringe to the vial adapter.

3. While holding the plunger down, turn syringe with vial upside down. Pull back the plunger to withdraw single dose (2 ml) into the syringe.

4. Remove the syringe from the vial adapter. The vaccine is ready for administration.

5. Administer the entire content of the syringe orally (on the inside of the cheek). The child should be seated in a reclining position. Do not inject.

Multidose vial: Leave the vial adapter on the vaccine vial. Use a fresh syringe for second dose after withdrawal and administration of first dose.

Revision date: 11/2021

SII Vaccin AntiRotavirus Vivant Atténué (Oral) Liquide ROTASIIL - Liquid

DESCRIPTION

ROTASIIL-Liquid [Vaccin AntiRotavirus, Vivant Atténué (Oral), Liquide] fourni par Serum Institute of India Pvt. Ltd est un Vaccin AntiRotavirus Pentavalent Réassorti Humain-Bovin Liquide (LBRV-PV). Le vaccin se compose de cinq virus (souches réassorties humaines et bovines) des sérotypes G1, G2, G3, G4 et G9. Tous ces souches constituent le gène VP7 du sérotype respectif à partir de souches humaines réassorties avec le rotavirus bovin (Royaume-Uni). Chaque souche est propagée dans les cellules VERO individuellement; et toutes les cinq souches sont mélangées avant le remplissage.

*Utilisez une nouvelle seringue pour administrer chaque dose. La pastille de contrôle du vaccin (voir l'image), pour ce type de vaccin est attachée au bouchon du flacon et doit être jetée lorsque le vaccin est utilisé. Tout vaccin non utilisé ou déchet doit être éliminé en conformité avec les exigences locales. Le vaccin ne doit pas être mélangé avec d'autres produits médicinaux.

Pour l'administration du vaccin par voie orale, consultez la rubrique « Instructions d'utilisation ».

sur la consommation de nourriture ou de liquide par l'enfant, y compris le lait maternel, soit avant ou après la vaccination avec ROTASIIL-Liquid.
Il est recommandé que les nourrissons, qui reçoivent ROTASIIL-Liquid comme la première dose, complètent la série de trois doses avec ROTASIIL-Liquid. Il n'y a pas de données sur la sécurité, l'immunogénérité ou l'efficacité du ROTASIIL-Liquid lorsqu'il est administré de façon interchangeable avec d'autres vaccins antirotavirus disponibles. Dans le cas où une dose incomplète est administrée (le bébé régitre la plupart de la quantité vaccinée), une dose unique de remplacement peut être administrée pendant la même visite de vaccination*. Le bébé peut continuer à recevoir les doses restantes selon le calendrier.

*La décision du médecin est conseillée

Posologie :

Chaque dose orale unique de ROTASIIL-Liquid est de 2 ml en volume. Le vaccin est disponible dans un flacon prêt à l'emploi. Si l'intégrité du flacon vaccinal a été compromise, ce flacon particulier doit être jeté. Le contenu du flacon doit être inspecté visuellement pour toute particule étrangère et / ou aspect physique abnormal avant l'administration. Si une partie étrangère ou une altération de l'aspect physique est observée, il faut jeter le vaccin. Le vaccin doit être utilisé immédiatement. Si le vaccin n'est pas utilisé immédiatement, il peut être gardé pour une période de 6 heures au maximum, pourvu qu'une seringue* soit utilisée pour boucher l'ouverture de l'adaptateur vaccinal et que cet assemblage entier soit conservé entre 2°C et 8°C.

*Utilisez une nouvelle seringue pour administrer chaque dose. La pastille de contrôle du vaccin (voir l'image), pour ce type de vaccin est attachée au bouchon du flacon et doit être jetée lorsque le vaccin est utilisé. Tout vaccin non utilisé ou déchet doit être éliminé en conformité avec les exigences locales. Le vaccin ne doit pas être mélangé avec d'autres produits médicinaux.

Pour l'administration du vaccin par voie orale, consultez la rubrique « Instructions d'utilisation ».

CONSERVATION
ROTASIIL-Liquid doit être conservé entre +2°C et +8°C. Garder à l'abri de la lumière. NE PAS CONGÉLER.

DURÉE DE CONSERVATION

24 mois. Ne pas utiliser après la date de péremption.

PRESENTATION

Flacon de 4 ml - 2 doses

PASTILLE DE CONTRÔLE DU VACCIN (PCV) (Optionnel)

Les pastilles de contrôle du vaccin (PCV) se trouvent sur le bouchon du flacon de ROTASIIL-Liquid fourni par Serum Institute of India Pvt. Ltd. Il s'agit d'un point sensible au temps écoulé et à la température et indique la chaleur cumulative à laquelle le flacon a été exposé. Cela avertit l'utilisateur final au cas où l'exposition à la chaleur aurait dégradé le vaccin au-delà d'un niveau acceptable.

L'interprétation de la PCV est facile. Il ne faut que se concentrer sur le carré intérieur. Sa couleur changera progressivement. Tant que la couleur du carré est plus claire que celle du cercle extérieur, on peut utiliser le vaccin. Lorsque le carré central est de la même couleur que le cercle extérieur ou devient plus foncé que le cercle extérieur, on doit jeter le flacon.

INSTRUCTIONS POUR L'UTILISATION

Pour administrer le vaccin par voie orale:

Portuguese

Vacina Anti-Rotavírus Viva, Atenuada (Oral) Líquida ROTASIIL - Liquid

DESCRIÇÃO

ROTASIIL-Liquid (Vacina de Rotavirus, Viva Atenuada (Oral), Líquida) fornecida por Serum Institute of India Pvt. Ltd. é uma Vacina Pentavalente Líquida do Rotavirus, com Rearranjo Bovino e Humano (LBRV-PV pela sua abreviação em inglês). A vacina constitui cinco vírus (estripos com rearranjo bovino e humano) do sorotipo G1, G2, G3, G4 e G9. Todas estas estripos constituem o gene VP7 do sorotipo respetivo das estripos humanas rearranjadas com o rotavirus bovino (UK). Cada estripo propaga-se nas células VERO individualmente e todas das cinco estripos se misturam antes do enchimento.

ROTASIIL-Liquid está disponível na forma de uma formulação líquida pronta para usar e tem o aspeto dum líquido translúcido amarelado com a presença possível de agregados inerentes ao produto. A vacina não contém conservantes. ROTASIIL-Liquid é para a administração oral e não para a injeção. A vacina cumpre os requerimentos da IP e da Organização Mundial de Saúde (OMS).

COMPOSIÇÃO

Cada dose de 2 ml contém:

Rotavirus com Rearranjos Humano-Bovino Vivo, Atenuado [G1, G2, G3, G4 y G9]* ≥ 10^{5.6} FFU/ sorotipo

*Crescidos nas células vero
Excipientes: Ácido cítrico anidro, fosfato dibásico de potássio anidro, sacarose, gelatina hidrolisada, cloreto de zinco, cloreto de cálcio dihidratado, citrato trissódico tricálcico dihidratado e M&M de Eagle (Médio Essencial Mínimo) com sais de Hank, glutamina, bicarbonato de sódio e água para injetáveis.

Esta vacina não contém conservantes.

Dose: 2 ml - 1 dose pela administração oral.

INDICAÇÕES

A ROTASIIL-Liquid está indicada para a imunização ativa de recém-nascidos saudáveis da idade de 6 semanas para a prevenção da gastroenterite devida à infecção pelo rotavírus quando é administrada numa série de 3 doses. O esquema de vacinação de três doses deve ser concluído até a idade de um ano.

CONTRAINDICAÇÕES

A hipersensibilidade a qualquer componente da vacina é uma contraindicação para a vacina. Os indivíduos que desenvolvem sintomas que sugerem a hipersensibilidade depois de receber uma dose da ROTASIIL-Liquid não devem receber doses adicionais. Os recém-nascidos com uma história da malformação congénita não corrigida do trato gastrointestinal, que pudesse predispor ao recém-nascido à intussuscepção, não devem receber a vacina. Os indivíduos com a Doença da Imunodeficiência Severa Combinada (SCID pelas suas siglas em inglês) não devem receber a vacina já que ocorreram casos de gastroenterite associada com outras vacinas vivas do rotavírus nos recém-nascidos com SCID. A história de intussuscepção (IS) é uma contraindicação para a administração da vacina.

ADVERTÊNCIAS & PRECAUÇÕES

Não estão disponíveis dados de segurança e eficácia da ROTASIIL-Liquid em recém-nascidos imunocomprometidos, recém-nascidos infetados com VIH ou recém-nascidos com a gastroenterite crônica. A administração da ROTASIIL-Liquid pode ser considerada com caução em recém-nascidos imunocomprometidos e bebés em contacto próximo com pessoas imunodeficientes, se no opinião do médico, o benefício pesa mais do que os riscos da vacina. De mesmo modo, a infecção aguda ou a doença febril pode ser um motivo para retardar a administração da ROTASIIL-Liquid se no opinião do médico, o benefício pesa mais do que os riscos da vacina. A febre de baixo grau e a infecção leve do trato respiratório superior não são contraindicações para a ROTASIIL-Liquid.

Os dados publicados disponíveis revelam uma pequena incidência aumentada de intussuscepção (IS) após receber outras vacinas vivas orais contra o rotavírus, especialmente depois da primeira dose. Os dados de segurança das provas clínicas da ROTASIIL-Liquid (a formulação liofilizada de BRV-PV [pelas suas siglas em inglês] já licenciada) não revelaram um risco aumentado de IS quando comparado com o placebo. Nas provas de fase III, não foi relatada a intussuscepção nos grupos com a ROTASIIL-Liquid e a Vacina de Rotavirus. De qualquer modo os profissionais de saúde devem avaliar as suas com sintomas que sugerem a IS.

Parecida a outras vacinas de rotavírus, pode ser que a vacinação com a ROTASIIL-Liquid não proteja a todos os vacinados contra a infecção de rotavírus. Assim mesmo, a ROTASIIL-Liquid não proporcionará a proteção contra a gastroenterite causada por outros patógenos.

Interações medicamentosas

As terapias imunodpressoras incluindo a irradiação, antimetabolitos, agentes alquilantes, drogas citotóxicas e corticosteroides (usadas em doses maiores da dose mínima) podem reduzir a resposta imune às vacinas.

A ROTASIIL-Liquid pode ser administrada concomitantemente com outras vacinas do programa de imunização infantil, incluindo a vacina combinada de difteria, toxoide tetânico e pertussis (DTP), a vacina inativada do vírus de pólio (IPV), vacina de pólio oral (OPV), vacina conjugada de H. influenzae tipo b (Hib) e a vacina da Hepatite B. Não foram realizados estudos de interação de com a ROTASIIL-Liquid em recém-nascidos com outros produtos medicinais.

No estudo de fase 2/3 da ROTASIIL-Liquid, três doses ou da ROTASIIL-Liquid ou a Vacina de Rotavirus, Viva Atenuada (Oral) (Liофilitizado) foram administradas com um intervalo mínimo de 4 semanas (intervalo máximo de 6 semanas) entre as doses. Todos os indivíduos receberam concomitantemente outras vacinas UIP de acordo com o calendário nacional de imunização (DTwP-HepB-Hib, bOPV, IPV). Além da UIP, a OPV também foi administrada em dias nacionais / subnacionais de imunização. As vacinas de BCG e vacinas pneumococicas também foram permitidas durante o período do estudo.

No estudo de fase 2/3 da ROTASIIL-Liquid, três doses da ROTASIIL-Liquid ou da Vacina de Rotavirus, Viva Atenuada (Oral) (Liофilitizado) foram administradas com intervalo de 4 semanas (intervalo mínimo de 4 semanas e máximo de 6 semanas) entre as doses. Todos os sujeitos receberam concomitantemente outra vacinação UIP de conformidade com o esquema nacional de imunização (DTwP-HepB-Hib, bOPV, IPV). Além da UIP, OPV também foi administrado nos dias da imunização nacional / subnacional; também foram permitidas as vacinas de BCG e a vacina pneumocócica durante o período de estudo.

Gravidez

A ROTASIIL-Liquid não está indicada para adultos, incluindo as mulheres de idade fértil e não deve ser administrada em mulheres grávidas. Os estudos de reprodução em animais não foram realizados com a ROTASIIL-Liquid.

REAÇÕES ADVERSAS

No prova de Fase III da ROTASIIL, não foram detectadas diferenças entre os grupos ROTASIIL e os grupos com placebo nas taxas pós-vacinação dos eventos adversos esperados dentro de 7 dias de receber cada dose da vacina. Do mesmo modo na prova de Fase III da ROTASIIL-Liquid não foram detectadas diferenças entre os grupos da ROTASIIL-Liquid e ROTASIIL nas taxas de eventos adversos esperados pós-vacinação dentro de 7 dias de cada dose da vacina. Estes eventos, em ordem decrescente por frequência foram:

A febre (64,6% no grupo da ROTASIIL e 64,6% no grupo com ROTASIIL, irritabilidade (51,5% no grupo com a ROTASIIL-Liquid e 50,5% no grupo com ROTASIIL, apetito reduzido (31,9% no grupo com a ROTASIIL-Liquid e 31,6% no grupo com ROTASIIL, vômitos (17,9% no grupo com a ROTASIIL-Liquid e 13,8% no grupo com o grupo com ROTASIIL e diarreia (12,1% no grupo com a ROTASIIL-Liquid e 13,8% no grupo com o grupo com ROTASIIL). A incidência de todos os eventos esperados foi semelhante nos grupos com a ROTASIIL-Liquid e no grupo com ROTASIIL. A maioria dos eventos foi de curta duração e predominantemente leve (74% dos episódios) na sua severidade. Deve-se tomar nota que no estudo de fase 3, a ROTASIIL-Liquid e no grupo com ROTASIIL foram administradas a todas as crianças concomitantemente com a vacina de DTwP, que segundo se sabe causa um nível reagentecidade semelhante ao que foi observado neste estudo.

A ocorrência de eventos adversos inesperados foi controlada durante o período interno da prova de fase 3 e a incidência foi parecida em ambos grupos. Os eventos adversos graves mais frequentes (EAG) observados incluiram bronquiolite, infecção do trato respiratório inferior e gastroenterite. Só um EAG de gastroenterite que ocorreu dentro de 7 dias depois da vacinação no grupo com ROTASIIL foi considerado como relacionado de forma causal.

Não foi relatado nenhum caso de morte ou de intussuscepção neste estudo.

Além disso, na prova de Fase III da grupo com ROTASIIL foram diagnosticados total de treze casos de intussuscepção; 6 ocorreram no braço com no grupo com ROTASIIL e 7 no braço com placebo. Não houve nenhum caso dentro de 28 dias depois de receber uma dose da grupo com ROTASIIL ou placebo. Nenhum dos casos estava relacionado com a vacinação do estudo ou levou à descontinuação do estudo.

POSOLOGIA E ADMINISTRAÇÃO

ROTASIIL-Liquid destina-se EXCLUSIVAMENTE PARA A ADMINISTRAÇÃO ORAL E NÃO DEVE SER ADMINISTRADO PARENTEALMENTE.

Posologia:
ROTASIIL-Liquid deve ser administrada num esquema de 3 doses, com intervalo entre elas de 4 semanas, começando à idade de 6 meses. O esquema de três doses deve ser concluído até a idade de um ano. ROTASIIL-Liquid pode ser administrada concomitantemente com outras imunizações rotineiras da infância (isto é Difteria, Tétano e Coqueluche [DTwP], vacina da hepatite B, vacina de H. influenzae tipo B (Hib), vacina inativada antipoliomielítica (IPV), vacina antipoliomielítica oral (OPV). Devido à distribuição etária típica da gastroenterite pelo rotavírus, a vacinação de crianças > 24 meses não é recomendada. Com base nas recomendações do Organização Mundial da Saúde, se as imunizações rotineiras na infância forem iniciadas depois da idade de 6

Живая аттенуированная вакцина жидкая (пероральная) для профилактики ротавирусной инфекции ROTASIIL - Liquid

ОПИСАНИЕ

Вакцина ROTASIIL жидкая [живая аттенуированная вакцина жидкая (пероральная) для профилактики ротавирусной инфекции], поставляемая компанией «Серум Институт Офф Индия Птд.», является жидким бычьим реассортантом ротавируса человека – пентавалентной вакциной (LBRV-PV). Вакцина содержит пять серотипов вируса (человеческие и бычие реассортантные штаммы): G1, G2, G3, G4 и G9. Все эти штаммы содержат ген VP7 соответствующего серотипа из человеческих штаммов, реассортированных с ротавирусом крупного рогатого скота (источник: Соединенное Королевство). Каждый штамп отдельно культивируют на клетках VERO; все штаммы смешиваются перед разливом.

*Рекомендуется для ввода отдельно или одновременно с вакциной АКДс. Ограничений на прием владеющим пищи и жидкости, включая грудное молоко, как до, так и после вакцинации вакциной ROTASIIL жидкой, отсутствуют.

В случае введения неполной дозы (ребенок срыгивает большую часть вакцины), допускается ввести дополнительную (замещающую) дозу в ходе того же посещения для вакцинации*. Остальные дозы могут быть введены в соответствии с инструкциями врача.

*Рекомендуется для усмотрение врача.

Введение дозы

Объем одной дозы вакцины ROTASIIL жидкой составляет 2 мл. Вакцина выпускается во флаконах в готовом к применению виде. Если целостность флакона с вакциной была нарушена, этот флакон следует утилизировать.

Перед введением содержимое флакона следует визуально проверить на наличие посторонних частиц и/или несвойственного внешнего вида. В случае обнаружения любого из указанного вакцину утилизируют. Вакцину следует использовать немедленно. Если ее не используют немедленно, ее допускается хранить в течение не более 6 ч при условии, что шприц* используется для закрытия отверстия адаптера флакона и хранения при температуре 2-8°C.

* Для введения каждой дозы необходимо использовать новый шприц. Для данного типа вакцины используется контроль флакона с вакциной (см. рисунок), прикрепленный к колпачку флакона, его следует удалить при начале использования.

Введение дозы

Вакцину ROTASIIL жидкой следует хранить при температуре от +2°C до +8°C.

Хранение

Вакцину ROTASIIL жидкой следует хранить при температуре от +2°C до +8°C.

Хранение в защищенным от света месте. НЕ ЗАМОРАЖИВАТЬ.

СРОК ГОДНОСТИ

24 мес. Не использовать после истечения срока годности.

ФОРМА ВЫПУСКА

4 мл – флакон с 2 дозами

ФЛАКОННЫЙ ТЕРМОИНДИКАТОР (ФТИ) (дополнительно)

пероральная [ВПП]. В связи с типичным возрастным распределением случаев ротавирусного гастроэнтерита, вакцинация от ротавирусной инфекции не рекомендует для детей в возрасте > 24 мес. На основании рекомендаций Всемирной организации здравоохранения, если плановая иммунизация детей начинается в возрасте старше 6 недель и/или с интервалом дозирования более 4 недель, вакцину ROTASIIL жидкой допускается вводить отдельно или одновременно с вакциной АКДс. Ограничений на прием владеющим пищи и жидкости, включая грудное молоко, как до, так и после вакцинации вакциной ROTASIIL жидкой, отсутствуют.

В случае введения неполной дозы (ребенок срыгивает большую часть вакцины), допускается ввести дополнительную (замещающую) дозу в ходе того же посещения для вакцинации*. Остальные дозы могут быть введены в соответствии с инструкциями врача.

ФЛАКОННЫЙ ТЕРМОИНДИКАТОР (ФТИ) (дополнительно)

Контроль флакона с вакциной (VVI) находится на колпачке флакона вакцины ROTASIIL жидкой, поставляемой компанией «Серум Институт Офф Индия Птд.». Контроль показывает сквозу теплое, полученные в фланкере, цвета. Контроль предупреждает конечного пользователя, когда воздействие тепла может привести к ухудшению качества вакцины сверх допустимого уровня.

Интерпретация показаний ФТИ простая. Смотрите на центральный квадрат. Его цвет изменяется с течением времени. Показатель цвета этого квадрата светлее цвета внешнего края, вакцину нельзя использовать.

Наклонение со временем теплового воздействия

Контроль флакона с вакциной (VVI) находится на колпачке флакона вакцины ROTASIIL жидкой, поставляемой компанией «Серум Институт Офф Индия Птд.». Это точка, чувствительная к температуре и времени, которая показывает сквозу теплое, полученные в фланкере, цвета. Контроль предупреждает конечного пользователя, когда воздействие тепла может привести к ухудшению качества вакцины сверх допустимого уровня.
