WHO recommendations for augmentation of labour

May 2014
Optimizing outcomes for women in labour at the global level requires evidence-based guidance of health workers to improve care through appropriate patient selection and use of effective interventions. The goal of the present recommendations is to consolidate the guidance for effective interventions that are needed to reduce the global burden of prolonged labour and its consequences. The primary target audience includes health professionals responsible for developing national and local health protocols and policies, as well as obstetricians, midwives, nurses, general medical practitioners, managers of maternal and child health programmes, and public health policy-makers in all settings.

**WHO Recommendations**

- **WHO recommendation on the use of active phase partograph with a four-hour action line for monitoring the progress of labour**
  Updated: May 2014
